From: Dennis Neese
Topic: 5094 Message: 5150

To answer your question about more then one version of Fldigi. I have multiple versions of stable releases and alpha versions
and never have had a problem. Just to give you an idea, last week I took a look and have at least 15 different versions and still
do not have any interference. You should only run one version at a time. My system isWindows7 with a Signalink and a Kenwood TS2000.

Subject: [paNBEMS] New TS-590S HOWTO: SSB Audio Setup

I have just posted a new HOWTO document on the "TS-590S Resources Page":

http://homepage.ntlworld.com/wadei/ts-590s.htm

Click on the red "HOWTOs" button.

Then select HOWTO #20: "TS-590S HOWTO: SSB Audio Setup".

The HOWTO is a step-by-step guide to setting up really effective TX
audio on the TS-590S. Includes background information on:

· Factors that affect the audio

· Menu A/ Menu B organization

· TX equalizers

· Low/High Cut filters

· ALC and speech processing.

Includes large diagrams showing in detail the permissible levels for ALC
and compression.

Hardware requirements.

Detailed setup procedures for unprocessed and processed audio.

Appendix 1 describes the use of ARCP-590 for setting up User-defined TX
equalizer profiles.

Appendix 2 describes how to record TX audio, using an undocumented
TS-590S feature for feeding the monitored audio to a PC via the USB
cable.

The HOWTO described above covers the practical steps in setting up the audio. To complement the HOWTO, the TechNote on SSB Audio Handling has a summary of the many features built into the Kenwood TS-590S.

To find the TechNote, go to the "TS-590S Resources Page":

http://homepage.ntlworld.com/wadei/ts-590s.htm

Click on the blue "TECHNOTES" button, then select TechNote #2: "TS-590S TechNote: SSB Audio Handling".

The TechNote includes full details for setting the audio equalizers and cut-off filters, together with configuring TX keying (by VOX, PTT and external CAT commands). Also dispels some of the myths and misunderstandings arising from Kenwood’s inappropriate use of the word "DATA" in its documentation. Now includes details of the built-in TX and RX equalizer profiles.

Plenty of reading for the CQ World Wide DX Contest this weekend!

5153. monitoring 3.583 USB 1500 Hz center tonight for FLMSG or FLAMP

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-10-26 22:54:23 UTC
From: David Kleber
Topic: 5153 Message: 5153

Hello all,

I'll be monitoring 3.583 USB, 1500 Hz waterfall with my RxID on. Primary monitoring mode is 8/500 Olivia, but feel free to put out an FLMSG or FLAMP transmission on a different mode... just please make sure you us TxID.

I'll be in and out of the shack but will leave the station here set to monitor.

FLAMP was updated today to 1.0.0AY (http://www.w1hkj.com/alpha/flamp/) with some new schedule/beacon features. Current FLDIGI Alpha as of today still remains at 3.21.59EXP03 (http://www.w1hkj.com/alpha/fldigi/v3.21/).

Recommended EXP modes are 4xPSK63R, 4xPSK125R and 5xPSK125R under OpMode, exp PSK-Multi in the FLDIGI alpha program.

5155. flamp/fldigi versions for Sandy operations

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-10-27 20:09:24 UTC
From: John Spickes
Topic: 5155 Message: 5155

Are there plans to make use of flamp during the upcoming Sandy event?
If so, should we standardize on a particular version? Likewise, is there
any plan to use the experimental fldigi modes? Which version?

I'll plan to get everything installed with the proper versions before we
need them.

Best of luck, and hope everyone's preparations are going well.

From: David Kleber
Topic: 5155 Message: 5156

John,

The current alpha versions of FLDIGI (3.21.59EXP03) and FLAMP (1.0.0AZ) have been testing solid and stable.

Here's the links for download:
http://www.w1hkj.com/alpha/fldigi/v3.21/

http://www.w1hkj.com/alpha/flamp/

FLAMP Quick Start guide:
http://www.w1hkj.com/alpha/flamp/FlampQuickStart.pdf

My opinion is that these versions are stable enough to use ONLY if we run into a situation where larger file transfers are necessary between ops that have previously read the quick start AND have successfully tested previously with the high speed FLDIGI alpha modes and FLAMP.

The preferred HF mode for FLAMP and FLDIGI 3.21.59EXP03 is 5xPSK125R which works very well with moderate to strong signals and relatively quiet band conditions for file transfers up to about 10k with FLAMP set at 128 block size, and base 64 compression. If you are not experienced in FLAMP and try this high speed mode and FLAMP under the wrong conditions, you're just going to waste a lot of air time and bandwidth...

I would HIGHLY advise against anyone moving to FLAMP for the first time in an emergency situation and would recommend that we stick with what we're trained on and what we know works. The current standard releases of FLDIGI and FLMSG on www.w1hkj.com are stable and reliable.

Let's all hope that Hurricane Sandy doesn't do what they're predicting what she'll do. But, the time is now to get ready. Top off your batteries, fill the gas tanks and prepare for possible extended power outages if you're in the predicted affected areas.

Here's one of our bulletins from this morning's paNBEMS net:

##########

POLEWARD MOVING SANDY WILL AGAIN BECOME A POWERFUL STORM AS IT
TURNS WEST ON MONDAY...SLAMMING INTO THE NORTHERN MID ATLANTIC
COAST LATE MONDAY EVENING WITH A PERIOD OF 60 TO 75 MPH WIND GUSTS.

NY-NBEMS will be monitoring and operating on 7.036 USB, 1500 Hz waterfall center, 8/500.

In PA, possible phone/voice net ops with PEMA/ACS will be on 3.9905 LSB, 3.9935 LSB and ARES on 3.983 LSB or 7.272 LSB.

Until any formal nets are activated by ACS or ARES in PA, paNBEMS will monitor daylight hours 7.0725 USB , 1500 Hz waterfall center, 8/500 and night time on 3.583 USB, 1500 Hz waterfall center, 8/500 olivia.

paNBEMS will attempt to send situation report bulletins with Olivia 8/500 followed by MT63 1000 Hz or 500 Hz long interleave at the following daily schedules in local Eastern Time:

Noon - 3.583 USB
6pm - 7.0725 USB
8pm - 7.0725 USB
Midnight - 3.583 USB

Charge all your batteries, top off your fuel.

########

Please keep in mind that PEMA/ACS uses the paNBEMS spots and if their net activates, they have priority on 3.583 USB, 1500 Hz and here on 7.0725 USB, 1500 Hz center waterfall, so if you check in, pse listen for several minutes before putting out a call.

Andy,

It was sent in FLMSG. We are reserving the use of FLAMP to ONLY situations between FLAMP experienced ops (only a few of us at this point in alpla testing) for files too large for FLMSG.

For the next week or so (depending on Sandy outcome) we're pretty much suspending FLAMP use and testing.

Here in LeSueur, in southern Minnesota, we started using the local repeater for training. After the usual Sunday night net, we had a round table and sent out digi bulletins. This was not a continuous activity...those who were interested got things going, and when the interest died out, the activity ceased.

Don, kc0qna, organized training sessions. He got trainers and those who were successful together with those who were interested. Used power point presentations available from the NBEMS website, and lots of personal attention. Hams brought their radios and their laptops.

In my not very humble opinion, without continuous training on nets, digi networks will not develop . I truly believe that a prioritized list of skills to be learned should be developed and worked on. Otherwise I think the digi nets become pointless.

Subject: [paNBEMS] Digital Usage and Equipment Survey

We are trying to get more activity in this area using FLdigi.

We would like to do a survey of the area Hams and club

members. We are trying to find out who has what, and what

software they are using.

Has anyone done something similar and how did you go about doing it?

Jerry,

Larry KB0EMB from KC metro here.

In my opinion - Fldigi and the other NBEMS programs should be the standard for digi mode use. While there are plenty of good programs, none fit all the capabilities that NBEMS can. That said, there are circumstance where Winlink (RMS Express) can also serve a very useful purpose. A varied set of tools is quite important.

Both HF and VHF are well suited for fldigi so I try to use equipment that has the "MiniDin-6" connector to minimize cables from my SignaLink to whichever radio is used. I believe many have preference for the SignaLink interface, has worked well for me on many varied digital modes. I have found the range on VHF simplex quite good, allowing decoding with less signal than voice would require for comprehension of the message.

Hope that helps,
Larry KB0EMB

Hi Jerry,

In my part of Maine (midcoast area) we have our county RACES-CERT equipment base augmented with several digital capabilities. The counties that I am familiar and work with include Waldo, Kennebec and Knox.

APRS: longstanding usage for search and rescue. We use UI-View in the comms trailers and EOCs and have a fair number of portable trackers.
NBEMS: now fairly well established but needing more trained operators. Fldigi, flmsg are in use and we are working with flamp. We have weekly 2 and 6 meter nets. NBEMS capabilities are in the EOCs and comms trailers and some of the public safety radios are also equipped with Signalinks and NBEMS. At least two other counties have used NBEMS but to a limited extent.
EasyPal: This has been used by the Waldo county team for sending images during SARs and "fun" events like canoe races.
Packet: Very limited use by Waldo and Kennebec counties. Software is Winpack but I'm working with Waldo to upgrade to Outpost.
Winlink: Some use by Hancock county (VHF with one server); no other activity within Maine that I am aware of.

Here in Thunder Bay we have Salvation Army Headquarters (EOC) digitally equipped as well and can run HF/VHF etc digital all bands. I am also working on a netbook for our Salvation Army Van that is also equipped with an FT857 radio.

At 55 plus center VE3SAO, we are also equipped with digital ready gear and all modes and bands.

Many of my EC's with ARES are on digital as well, and we in Thunder bay use digital lots with hubs set up with and without internet.

We have VE3ONN-5 currently configured to scan both 40 and 80 meters using WL2K and that is filling the void for communications within the Northwestern part of Ontario using 80 meters and allowing us to communicate with more distant stations on 40 meters and into the Greater Toronto area etc, the system scans every 6 seconds and uses 7.088 and 3.618

This is a reply I got back in April regarding Digital Traffic Nets:

I agree with name comments. Winlink (2000 edition) is the outcome of a call by the US government to the ARRL (and Amateur community at large) to create a national digital system. Winlink Classic was evolved to include the capability to add attachments to commercial standard (SMTP) emails and dispatch them into the Internet through any of the HF gateways. In 2004 they created the TELPAC module making 2/440 packet radio gateways possible. Today they have created a wholly new system with software written in modern language, and all of that will shortly be replaced with yet another fully integrated and robust system. Of note, one of the five "Central Message Servers) located across the globe is physically located in the Nova Scotia EMO/Halifax Region joint EOC. While I use Winlink via HF for personal use while on recreation deployments, I operate a fully capable "hubbing VHF/UHF RMS Packet gateway" here in Barrie and it is tied into a packet radio network that spans from Huntsville south into the GTA and now extends out to the Brampton/Mississauga area. I think it will shortly expand westward into Mississauga and the Hamilton area.

The huge benefit of Winlink is that the client's computer can be networked with the AR computer so that the client does all the 'gafingerpoking' creating the email, attaches his/her own attachment, using their normal commercial email application with an added Winlink account. When they hit the send button the email is uploaded to the AR mail server (Paclink) and off it goes over the air if an Internet connection is not available. Couldn't be simpler. If the Internet has gone down the RMS Packet goes into store and forward mode so any outlying Paclink station can poll the RMS and carry on business. It's the old FBBS package at the core, complete with B2 compression so that all traffic is sent as binary files (and therefore

unreadable to the casual monitor). If you need to forward outside the local network then a manual intervention can cause an HF exchange with an out-of-area HF gateway. It is REALLY slick.

Outpost, NBEMS, etc. systems are, at the end of the day, very intensive manual operations. Great stuff at the hobby level, but they are not yet sophisticated enough to send the attachments as binary files at reasonable throughput rates. My local group has been working away at NBEMS now for awhile and don't think the typing skill levels or especially the specialized knowledge of the needed to accurately transcribe the administration documents is ever going to be sophisticated enough to meet the needs of the client base. Better to leave that whole aspect to them, leave it to them to create the "message" and dump it into the Paclink hopper/receive the reply automatically from the Paclink server. The ARO still needs to be there to supervise and handle voice/coordination traffic, but the message "handling" is left to the Subject Matter Experts.

As name says, the WL2K system is 24/7/365 and functions for the most part completely unattended. If you have the radio equipment to operate Outpost it is only a question of installing the freeware WL2K applications and picking a spot to be the 24/7 gateway (need assured power and Internet connection as well as physical security and IT support. My sponsor is the IT Department in the local hospital, which very conveniently sits on close to the highest ground in Barrie.

So that is where the ball sits here at the moment, I am having the same struggle just in our area to find the common denominator for message handling and everytime it turns to WL2K because of the peer-to-peer and ARQ messages sent to one person or only those whom the message is intended.

Other comments' from some EC's is that FLDIGI is too busy looking and hard to navigate, I don't agree but like WL2K of which I was also a beta tester in its early beginnings it too went through daily upgrades and changes to the point that we now have a stable platform with the odd automatic update still taking place. Like all modes it has to be played with, experimented with and taught to people, not just given to them via a link and say "Here you go, now learn how to use it"..I am a Safety Consultant and know very well about teaching people to use stuff, and sometimes it is not an easy task.

For me FLDIGI and FLMSG are absolutely great, the suite is amazing, during our SET we used FLMSG to generate and open messages that were sent to our internet-free WL2K hub, it proved itself over and over again.

This is our log from our SET just a few weeks ago, also note that we did attempt to use PSK31 between Thunder Bay and Dutton but band cdx were bad.

Hi,

I hope all affected by Sandy are doing OK. Looks like DE/NJ/PA is taking the brunt of it. The wind is picking up here in South West CT. Power and internet on so far.

I'm monitoring 7.0725 for any NBEMS traffic. Let me know if a different spot would be more appropriate.

Our EOC is open but I'll be at home until the worst of the storm is done.

73,

Sander W1SOP

The Awards Committee is pleased to announce the winners of the 2012 Atlantic Division Awards.

Harry Bloomberg W3YJ was awarded the Technical Achievement Award.
Harry has been involved in NBEMS (Narrow Bank Emergency Message System) Harry has tirelessly taught clubs and EmComm groups about using NBEMS, and just recently Senegal and France have mentioned to Harry they would like to adopt NBEMS for their local hams to use. Harry also serves the WPA Section as its Assistant Section Emergency Coordinator.

Harry has done a lot for amateur radio and deserves this award. I just met a local ham that is full of enthusiasm after attending one of Harry's seminars. In the scientific world when awarding a Nobel Prize they sometimes award it to more than one person, particularly when more than one person has contributed to the overall task. So perhaps we should also give a nod to Dave KB3FXI who used to be on the road with Harry and also brings much to our hobby when it comes to NBEMS

Harry Bloomberg demonstrated Narrow Band Emergency Messaging Software (NBEMS) to those of us who attened EMCOMM East in Rochester, New York, a few years ago and did a fantastic job of explaining how easily it could be used, even with just a couple of handheld radios. What good news to see that his tireless work is being rewarded in a public way.

From: David Kleber
Topic: 5182 Message: 5182

First, let's keep those in the affected areas of Hurricane Sandy in our thoughts and prayers. They have a long, hard road to recovery.

Here in WPA, we got much less in the way of high winds than expected and only sporadic power outages and some minor flooding. ARES and PEMA/ACS only had WPA on standby.

When in standby mode with HF phone nets being the primary point of contact, it's pretty hard to expect everyone to be sitting by their stations and monitoring continuously. It seems like it would be a good idea, before we are called into a standby condition, that there would be set schedules to tune in on SSB HF phone/voice nets and get information or check in. Maybe something like 8am, noon, 6pm, 8pm and 10pm.

NBEMS, on the other hand, provides the MAJOR advantage of being able to park on a call spot, leave the station in monitor mode, then when the op returns to the station, all the messages (and even raw received keyboard to keyboard text) are at their disposal... but I'm probably just preaching to the choir here. This capability helps to disseminate information much more efficiently and helps to prevent unnecessary request for information when you return to your station, where if you were voice only, you have to call into an HF SSB net to get details that have already been repeated to other operators previously.

The disadvantage with NBEMS is that we don't have the strength in numbers as compared to those with SSB phone/voice. But, where we do have NBEMS ops, they can take pertinent info from HF NBEMS bulletins, such as phone net monitoring frequencies and schedules, shelter activations, manpower request and any other information that can be passed in text, down to their local VHF/UHF nets, providing basic info to those without NBEMS or SSB HF capabilities. As we all know, there's nothing easier than relaying digital messages to and from various nets and operators.

Another major advantage with NBEMS on HF regional nets is that we can maintain a bulletin spot while also running a traffic spot up 1500 hz or so in the same bandpass that it would take to run HF SSB phone/voice. This allows us to see when there is traffic on the other spot while we're monitoring the bulletin spot or vice versa.

We'll be looking forward to getting reports from those in the affected area after the dust settles. Please post reports of your activities during and after Hurricane Sandy, here on the list, so we can all share in what worked and what didn't work.

5183. RE: [paNBEMS] Digital Usage and Equipment Survey

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-10-31 20:37:33 UTC
From: Jim
Topic: 5155 Message: 5183

After having tried, with only very limited success, to get WL2K (WinLink 2000) and associated programs to work with the other equipment currently in my radio room, it seems that the best use for WL2K would be to have that program set up and running on a separate computer/radio/antenna combination. Then have another similar combination to listen to any other band or mode (digital, RTTY, CW, SSB) that might be desired. For a person that has available funds for such a station set up, fine. For those that lack that level of funding for whatever reason, some of the negative comments made about the other digital programs and some of the radios and antenna selections can, and many times do, become very discouraging to a new operator wanting and trying to learn how to use the digital modes.

Just my thoughts.

Jim KD5VXH

Subject: RE: [paNBEMS] Digital Usage and Equipment Survey

Here in Thunder Bay we have Salvation Army Headquarters (EOC) digitally equipped as well and can run HF/VHF etc digital all bands. I am also working on a netbook for our Salvation Army Van that is also equipped with an FT857 radio.

At 55 plus center VE3SAO, we are also equipped with digital ready gear and all modes and bands.

Many of my EC's with ARES are on digital as well, and we in Thunder bay use digital lots with hubs set up with and without internet.

We have VE3ONN-5 currently configured to scan both 40 and 80 meters using WL2K and that is filling the void for communications within the Northwestern part of Ontario using 80 meters and allowing us to communicate with more distant stations on 40 meters and into the Greater Toronto area etc, the system scans every 6 seconds and uses 7.088 and 3.618

This is a reply I got back in April regarding Digital Traffic Nets:

I agree with name comments. Winlink (2000 edition) is the outcome of a call by the US government to the ARRL (and Amateur community at large) to create a national digital system. Winlink Classic was evolved to include the capability to add attachments to commercial standard (SMTP) emails and dispatch them into the Internet through any of the HF gateways. In 2004 they created the TELPAC module making 2/440 packet radio gateways possible.

Today they have created a wholly new system with software written in modern language, and all of that will shortly be replaced with yet another fully integrated and robust system. Of note, one of the five "Central Message Servers) located across the globe is physically located in the Nova Scotia EMO/Halifax Region joint EOC. While I use Winlink via HF for personal use while on recreation deployments, I operate a fully capable "hubbing VHF/UHF RMS Packet gateway" here in Barrie and it is tied into a packet radio network that spans from Huntsville south into the GTA and now extends out to the Brampton/Mississauga area. I think it will shortly expand westward into Mississauga and the Hamilton area.

The huge benefit of Winlink is that the client's computer can be networked with the AR computer so that the client does all the 'gafingerpoking' creating the email, attaches his/her own attachment, using their normal commercial email application with an added Winlink account. When they hit the send button the email is uploaded to the AR mail server (Paclink) and off it goes over the air if an Internet connection is not available. Couldn't be simpler. If the Internet has gone down the RMS Packet goes into store and forward mode so any outlying Paclink station can poll the RMS and carry on business. It's the old FBBS package at the core, complete with B2 compression so that all traffic is sent as binary files (and therefore unreadable to the casual monitor). If you need to forward outside the local network then a manual intervention can cause an HF exchange with an out-of-area HF gateway. It is REALLY slick.

Outpost, NBEMS, etc. systems are, at the end of the day, very intensive manual operations. Great stuff at the hobby level, but they are not yet sophisticated enough to send the attachments as binary files at reasonable throughput rates. My local group has been working away at NBEMS now for awhile and don't think the typing skill levels or especially the specialized knowledge of the needed to accurately transcribe the administration documents is ever going to be sophisticated enough to meet the needs of the client base. Better to leave that whole aspect to them, leave it to them to create the "message" and dump it into the Paclink hopper/receive the reply automatically from the Paclink server. The ARO still needs to be there to supervise and handle voice/coordination traffic, but the message "handling" is left to the Subject Matter Experts.

As name says, the WL2K system is 24/7/365 and functions for the most part completely unattended. If you have the radio equipment to operate Outpost it is only a question of installing the freeware WL2K applications and picking a spot to be the 24/7 gateway (need assured power and Internet connection as well as physical security and IT support. My sponsor is the IT Department in the local hospital, which very conveniently sits on close to the highest ground in Barrie.

So that is where the ball sits here at the moment, I am having the same struggle just in our area to find the common denominator for message handling and everytime it turns to WL2K because of the peer-to-peer and ARQ messages sent to one person or only those whom the message is intended.

Other comments' from some EC's is that FLDIGI is too busy looking and hard to navigate, I don't agree but like WL2K of which I was also a beta tester in its early beginnings it too went through daily upgrades and changes to the point that we now have a stable platform with the odd automatic update still taking place. Like all modes it has to be played with, experimented with and taught to people, not just given to them via a link and say "Here you go, now learn how to use it"..I am a Safety Consultant and know very well about teaching people to use stuff, and sometimes it is not an easy task.

For me FLDIGI and FLMSG are absolutely great, the suite is amazing, during our SET we used FLMSG to generate and open messages that were sent to our internet-free WL2K hub, it proved itself over and over again.

This is our log from our SET just a few weeks ago, also note that we did attempt to use PSK31 between Thunder Bay and Dutton but band cdx were bad.

From: Sander Pool
Topic: 5155 Message: 5184

Hi,

I run all kinds of software on my shack computer. RMS Express lives happily next to fldig and fj65-hf and HRD and WSPR. I simply pick what I want to run. A winlink 2000 server needs to run 24/7 on dedicated radio and antenna but that's not the only way to use wl2k. I have found it to be a very effective email backup system for personal use. Depending on the situation it may be desirable to send an email when there is no internet available. Winlink allows you to do that. I use WINMOR and practice this regularly. I keep notes of all my radio activities including which servers respond and how much power I needed to send an email.

I enjoy learning new ways to use my radio so I feel no need to reject one technology over an other. What I like about winlink is that I can reach non-hams. I can send an email to my family in Europe for example. With NBEMS this isn't straightforward. NBEMS has other qualities that make it more suitable for wide area emcomm than winlink.

73,

Sent: Wednesday, October 31, 2012 3:14 PM
Subject: [NBEMSham] fldigi-3.21.59 posted

http://www.w1hkj.com/

Version 3.21.59

Thumbdrive
* discover application executable location
* if the directory in which "fldigi" / "fldigi.exe" resides
contains a file named NBEMS.DIR then base all NBEMS file
locations to that drive-folder
* this allows a fully portble NBEMS installation
to a thumbdrive (or other portable drive)
* it also allows a very easy way to install multiple NBEMS suites
for different target uses on a single hard drive

UTF-8 overhaul
* Refactor get_tx_char()
* Reset to stock version, call byte_at()
The class Fl_Text_Buffer_mod (borrowed from FLTK) contained a
modified
version of the method char_at() that effectively made it behave as
byte_at(). Silently modifying a library-provided method not
only disables
the access to a certain functionality of the library, but can
also cause
other unforeseen consequences. The method was thus reverted to
the stock
version and the code that previously called the modified
version was
changed to call byte_at() instead.
* Remove unneeded code in FTextTX::nextChar()
* Libtiniconv
- Added libtiniconv (charset conversion library)
- Library Version 1.0.1 fetched from http://tiniconv.sf.net
A small fix made to change a misspelled macro name.
Build system adapted to fit into the fldigi build model.
* Added CharsetDistiller class
- Sanitize input data and convert it into UTF-8
- CharsetDistiller receives input data one byte at a time and
converts this
```

data stream from a particular character set into UTF-8.
Invalid input data
is treated as if it was encoded in CP1252. Character set
conversion is
performed as soon as possible, i.e., when enough input is
received to
constitute a valid character in the input character set, this
character is
immediatly converted into UTF-8 and made available at the output.
* Make put_rx_char_flmain() use charsetDistiller
* Make put_echo_char() use CharsetDistiller
* Make pskBrowser use CharsetDistiller
* Added OutputEncoder class
- Used for encoding transmitted data
- OutputEncoder accepts UTF-8 strings at input, converts them
to the
selected encoding and outputs them one byte at a time.
* TX character set conversion using OutputEncoder
* Fix backspace for >2byte UTF-8 characters
* Global setting for RX/TX charset
* Cleanup modem UTF-8 code
- PSK, Olivia, MT63 and MFSK modems:
cleanup of unneeded UTF-8 handling code
- Everything that deals with output character set conversion
and data
sequencing is now done using OutputEncoder, so the modems can
become
completely agnostic about the character set used. As far as
they are
concerned, everything is just byte-sized data.
* Added an array of character set names and identifiers
* UTF-8 code cleanup
- Cleanup of unneeded UTF-8 handling code in add_rxtx_char()
and family
* Character set selection menu
- Add menu button to select the active TX/RX charset to the
colors-fonts
configure dialog. The setting defaults to UTF-8 (selected
at program
startup). The selection is saved to the program defaults
configuration
file when "Config/Save" is executed.

73, Dave, W1HKJ

5188. focus on NBEMS - FLDIGI / FLMSG and now FLAMP

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-01 01:58:03 UTC
From: David Kleber
Topic: 5155 Message: 5188

I think we all know the differences, as well as the advantages and disadvantages, of most of the emcom amateur radio tools at our disposal.

Our focus at paNBEMS is helping in the training and development of NBEMS software and protocols for use in emergency communications.

I would like to limit the Winlink/Winmor discussion here to only topics that relate to how NBEMS and the other systems, and system ops, can work together.

Just earlier today, w1hkj has released the first general release of FLAMP along with updates to the standard versions of FLDIGI and FLMSG.

I would encourage all to download and install all the new versions and do some testing with FLAMP and please feel free to post your questions and feedback regarding the FLAMP application here to the paNBEMS list.

Here's the help file for FLAMP:
http://www.w1hkj.com/flamp-help/index.html

Please read the FLAMP help file before testing and if you're running the experimental high speed modes, make sure you're always running the must current version of FLDIGI alpha. FLDIGI alpha is open for testing and the download can be found at http://www.w1hkj.com/alpha/fldigi/v3.21/

Feel free to send your bug reports to kb3fxi at yahoo dot com

w1hkj has done some truly amazing work and has taken many of our ideas, WRAP and FLMSG as examples, and has turned our requests for features and functionality into working applications. FLAMP, combined with the new high speed experimental modes, is just the latest example of what I think will be the next game-changer in amateur radio emergency communications.

Thanks to all the folks on the list for your reports, feedback and especially to those who are actively testing on the air with the alpha NBEMS products. Mostly of all, thanks to w1hkj for the fantastic tools he has already given us.

From: David Kleber
Topic: 5189 Message: 5190

Andy,

I guess that the term "narrow" is subject to interpretation. Commercial microwave links certainly don't fit the description. Relative to VHF/UHF amateur comms, could MT63 2k long or the experimental mode 10xPSK125R be considered narrow? We have about 4.5k usable space on VHF/UHF FM and we're occupying that bandwidth regardless of what digital mode we use.

On HF, we're compliant on our digi allocations up to about 2.4k. So would 5xPSK125R., at slightly over 1k wide, be considered narrow band?

This is our list of suggested software for NYC-ARECS:

- FLdigi suite on HF and soon to be VHF nets
- packet using Outpost logging onto our JNOS BBS connected to internet
- MMSSTV for analog SSTV
- EasyPal for digital SSTV
- APRS for tracking mobile stations during bike tours, etc

Hello all,

Following the release of FLAMP yesterday, I'll be monitoring 7.0725 USB, 1500 Hz center waterfall today, from 11am to about 6pm, for testing with the newly released FLAMP protocol/application.

Please jump on and do some testing.

Make sure you have the latest standard release of FLDIGI and FLAMP from w1hkj.com (http://w1hkj.com/download.html), and also download and install the latest alpha version of FLDIGI at: http://www.w1hkj.com/alpha/fldigi/v3.21/ to help test some of the high speed modes along with FLAMP.

I'll be glad to work any stations in testing on the air along with a telephone call to walk you through the process.

-Dave, KB3FXI

100% copy in FLAMP of your short message to k3gwk, first 2 blocks were missed on first send but picked up on second repeat and filled in just fine..

Its 12:30 pm here in Minnesota, and I am enjoying watching the testing of FLamp and one of the faster modes (4xpsk125R) Signals on 40 meters are too weak for any copy with that mode, and actually, not great even with 8/500 olivia.

Ok, Dave and Fred,

We got a short flamp message through on olivia 8/500 to Buzz (K3GWK) on a really horrible path which was a really good test.

The high speed modes require a moderate to good path and have been testing very will with NVIS up to about 300 miles on both 40m and 80m. It will be interesting to see if the regional NBEMS nets will start testing but here on paNBEMS, we're passing files of sizes we would have never have tried before with great success.

I have been monitoring since you fellows started testing. Been busy changing out a window, but I kept coming in and checking the screen. For the longest time I decoded nothing with FLAMP. I ended up shutting it down and restarting it. Then it started working properly.

I thought about all that and after seeing KB3FXI mention a new alpha, I closed the older fldigi and opened the newer one without closing and restarting FLAMP. So I ask, is the order in which you start the programs important? If not, I have no idea why it started to decode.....

Ok, Buzz. Glad the test worked and please let us know if you have any questions or need any help.

Wait until you get on a good path on HF NVIS. Try 5xPSK125R in the FLDIGI alpha with FLAMP on HF and you'll see why we're hyping up FLAMP. Also try 10xPSK125R on a repeater or FM VHF/UHF simplex. There are even faster modes, but these are the best to start with.

All,

K3fll had about 3 missing blocks on my flamp file send and each time he hit ‘report’ on his famp receive window it sends the missing blocks and I then clicked on ‘xmit’ in the transmit window of flam and after two ‘reports’ his blocks filled in for 100% copy. I thought that was really neat. Very nice program code writing !!

I also like that the files one sends are in the transmit queue window so one can go back anytime and resend a file that was sent previously , of course, as long as the transmit queue window isn’t cleared out.

Dave says that wordpad is preferred to notepad for making files so I put the wordpad icon on the bottom tool bar.

Thanks to Dave for all the testing and pushing the limits. I think flamp looks like a winner.

Glen,

We were just barely able to pull off the path to Buzz in GA.

Let me know if you'd like to sked a test on 30 or 20 meters. We just wrapped up FLAMP testing on 40m so I can qsy now (4:30pm ET). Our spot on 30m is 10.135 USB, 1500 Hz and 20m we can try 14.0645 USB, 1500 Hz center.

I hear the crickets...

Another consideration for schedules, including digital schedules, is that we could find ourselves sitting in the dark after an event and need to conserve battery power.

If I only had to turn on my netbook 2 or 3 times a day to copy information at set skeds, I could probably go many weeks without a recharge.

>
> Here in WPA, we got much less in the way of high winds than expected and only sporadic power outages and some minor flooding. ARES and PEMA/ACS only had WPA on standby.
>
> When in standby mode with HF phone nets being the primary point of contact, it's pretty hard to expect everyone to be sitting by their stations and monitoring continuously. It seems like it would be a good idea, before we are called into a standby condition, that there would be set schedules to tune in on SSB HF phone/voice nets and get information or check in. Maybe something like 8am, noon, 6pm, 8pm and 10pm.
>
> NBEMS, on the other hand, provides the MAJOR advantage of being able to park on a call spot, leave the station in monitor mode, then when the op returns to the station, all the messages (and even raw received keyboard to keyboard text) are at their disposal... but I'm probably just preaching to the choir here. This capability helps to disseminate information much more efficiently and helps to prevent unnecessary request for information when you return to your station, where if you were voice only, you have to call into an HF SSB net to get details that have already been repeated to other operators previously.
>
> The disadvantage with NBEMS is that we don't have the strength in numbers as compared to those with SSB phone/voice. But, where we do have NBEMS ops, they can take pertinent info from HF NBEMS bulletins, such as phone net monitoring frequencies and schedules, shelter activations, manpower request and any other information that can be passed in text, down to their local VHF/UHF nets, providing basic info to those without NBEMS or SSB HF capabilities. As we all know, there's nothing easier than relaying digital messages to and from various nets and operators.
>
> Another major advantage with NBEMS on HF regional nets is that we can maintain a bulletin spot while also running a traffic spot up 1500 hz or so in the same bandpass that it would take to run HF SSB phone/voice. This allows us to see when there is traffic on the other

spot while we're monitoring the bulletin spot or vice versa.
>
> We'll be looking forward to getting reports from those in the affected area after the dust settles. Please post reports of your activities during and after Hurricane Sandy, here on the list, so we can all share in what worked and what didn't work.

Dave,

when Sandy is 'done' I'll read your post in my detail and respond. For now I can summarize that despite the destruction in our town my POTS line kept working and u-verse internet stayed up through the worst of it though it was down for about a day before coming back up this evening. Comcast cable is still down. We used a generator powered repeater to stay in touch in town although that was not strictly needed. Handy though when cellphone service is down. The EOC did not need hams for communications so I helped out with light IT work and other activities I'll elaborate on later.

I'm still without power but was able to score another 10G of gas for my generator so I can last another 3 days or so, more if I'm more cautious. Winter is coming our way. People who weren't prepared are in for a tough time. Still plenty of roads are blocked for vehicles. This hardly seems like a 1st world country here.

73,

Sander W1SOP

Ok, Sander... hang in there, sir... there's a reason why they call them "disasters". It may get worse before it gets better and you might find that you could be called into service.

I just responded to a request for radio op volunteers for SNJ. I have family I can stay with in Mauricetown, NJ if they request my deployment.

Dave,

I'm available for whatever the town needs and I can provide in a reasonable fashion. So far communication has not been an issue but that could indeed change. If I can make myself useful with computer training and process definition that's great. Tomorrow my son (Scout) will help his troop with food and water distribution. To be honest I'm not sure why we're handing out MREs when the store half a mile away is open but still.

I hope you won't get called to NJ but should that happen I applaud you for going. I wonder though what happened to the local hams. Keep us posted if you like.

This is quite a bit dated but this is the first that I heard of this story....

http://swling.com/blog/2012/05/decoding-wbcqs-digital-message/

How to decode WBCQ’s digital message
Posted on May 5, 2012 by Thomas
Last night, WBCQ’s sent a digital message about ten minutes before the end of the Allan Weiner Worldwide show. If you missed the broadcast, no worries; we recorded the show, and you can download the audio (below) to try decoding the message for yourself.
The digital message can be decoded using a variety of free software packages. The package we used–and which we use for many other digital modes–is FLDIGI, which can be found at http://www.w1hkj.com/Fldigi.html.
##########
The message had a lot of HTML code in it and seemed to be about some sort of smart phone software.

It is just a modified "wilderness protocol". I did that with an HF voice net, a local vhf net and the digital ops when I lost commercial power late Monday night until Tuesday evening. My two 20AH batteries kept things going.

Maybe "Wake on Sound" could help conserve battery power.

> >
> > When in standby mode with HF phone nets being the primary point of contact, it's pretty hard to expect everyone to be sitting by their stations and monitoring continuously. It seems like it would be a good idea, before we are called into a standby condition, that there would be set schedules to tune in on SSB HF phone/voice nets and get information or check in. Maybe something like 8am, noon, 6pm, 8pm and 10pm.
> >
> > NBEMS, on the other hand, provides the MAJOR advantage of being able to park on a call spot, leave the station in monitor mode, then when the op returns to the station, all the messages (and even raw received keyboard to keyboard text) are at their disposal... but I'm probably just preaching to the choir here. This capability helps to disseminate information much more efficiently and helps to prevent unnecessary request for information when you return to your station, where if you were voice only, you have to call into an HF SSB net to get details that have already been repeated to other operators previously.

> >
> > The disadvantage with NBEMS is that we don't have the strength in numbers as compared to those with SSB phone/voice. But, where we do have NBEMS ops, they can take pertinent info from HF NBEMS bulletins, such as phone net monitoring frequencies and schedules, shelter activations, manpower request and any other information that can be passed in text, down to their local VHF/UHF nets, providing basic info to those without NBEMS or SSB HF capabilities. As we all know, there's nothing easier than relaying digital messages to and from various nets and operators.
> >
> > Another major advantage with NBEMS on HF regional nets is that we can maintain a bulletin spot while also running a traffic spot up 1500 hz or so in the same bandpass that it would take to run HF SSB phone/voice. This allows us to see when there is traffic on the other spot while we're monitoring the bulletin spot or vice versa.
> >
> > We'll be looking forward to getting reports from those in the affected area after the dust settles. Please post reports of your activities during and after Hurricane Sandy, here on the list, so we can all share in what worked and what didn't work.

Date: 2012-11-02 20:15:21 UTC
From: w4iwk
Topic: 5206 Message: 5212

I caught the FLAMP tests yesterday and today with an unintended system on 7072.5 with FLAMP version 1.0. (I just installed 1.0.01AA). i have Fldigi 3.21.59EXP05, and Windows 7. Both FLAMP and Fldigi are installed in "Program Files"

I have all three boxes checked under "Configure" and FLAMP was open.

Fldigi is capturing the transmissions but nothing is showing up in FLAMP.

The debug_log starts with the FLAMP 1.0.1AA install and contains only paths.

Suggestions?

Thanks,
Irv W4IWK

5213. text glitches

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-02 20:12:55 UTC
From: David Kleber
Topic: 5213 Message: 5213

I'm seeing text glitches from one of our key alpha testing stations with paNBEMS and we're at a loss as to what is causing it. Here's an example from earlier today:

Yesterday there?)[]PIome problem at the beginning
and today it was droX &}Psxa[d then glitches.
I'll try rebooting but not now SQiTxAm going to just stop for8<DC4>}k1"j<i

We have done the sound card calibration and have verified that the sample rate setting is on 44100 (native). These glitches are occurring under very good conditions and I can not detect anything out of the ordinary on the received audio.

I recall seeing someone post some information on a windows application that helps manage and give priority to active programs.

If someone could repost the info on that application, it would be greatly appreciated.

Also, would it be worth trying a different sample rate... maybe have him set to 8000?

5215. FLAMP basics

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-03 21:40:50 UTC
From: David Kleber
Topic: 5215 Message: 5215

Hello all,

We'll be doing some FLAMP file transmissions at the end of the paNBEMS nets tomorrow.

I just uploaded a text file that covers the basics. The text is below.

Hope to see you on the net tomorrow. Make sure you have FLAMP 1.0.0 standard release installed from www.w1hkj.com. All you need to do for testing receive with FLAMP is make sure you open FLDIGI, then the FLAMP app and leave it running.

-Dave, KB3FXI
paNBEMS

NBEMS released first standard version of FLAMP. Download at:
http://w1hkj.com/download.html

Info on FLAMP:
http://w1hkj.com/flamp-help/index.html

FLAMP should prove to be a powerful tool for bulletin transmission and for larger messages and file transfers.

FLDIGI alpha with high speed modes is open for testing:
http://www.w1hkj.com/alpha/fldigi/v3.21/

Recommended modes for HF (opmode, exp PSK-Multi):
5xPSK63R, 4xPSK125R, 5xPSK125R

Rcommended modes for VHF/UHF:
5xPSK125R, 10xPSK125R, 6xPSK250R

Center all modes at 1500 Hz on the waterfall and on HF ops, uncheck the SQL software squelch button at the bottom right corner of the FLDIGI screen.

To send a file with FLAMP, here's the flow...

Go to the transmit tab view, click add, navigate to your file folder and highlight your file (plain text file from wordpad is recommended... save as plain text). After you highlight the file, click on "open" then your file will appear in the Transmit Queue.

If it's a large file (10k +), only going to one or two ops on a good path, go with the following settings:
- 128 or 256 block size
- 1x Repeat

If you have a medium sized file (3-10k) under moderate conditions:
- 64 or 128 block size
- 2x repeat

If you have a small message or bulletin under poor to moderate band conditions:
- 32 or 64 block size
- 3, 4 or even 5x repeat

After you send, the receiving stations who miss blocks press "Report" on their FLAMP Receive tab view. That injects the report data into the FLDIGI transmit window and is not automatically transmitted... the reporting station should wait for their call, then hit their transmit macro when and if they have a clear frequency.

The sending station (still in the Transmit tab view of FLAMP) then hits "Fetch" after they receive the missing block report. This feature seems to only work for me about 25-50% of the time. If after you hit "Fetch" you do not see the figures from the missing block report appear in the FLAMP "blocks" field in the Transmit tab view, just cut and paste the figures for the missing blocks from your FLDIGI received text into the blocks field then hit "XMIT", to resend just those missing blocks.

The ultimate goal is for us to practice enough, learn the capabilities of the different high speed modes according to varying conditions, and through a little bit of experience, send the right number of repeats and block size to try to assure that we get as few missing block reports as possible.

Dave, KB3FXI

5216. Fall Back - Time Change to Daylight Standard

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-04 00:53:30 UTC
From: David Kleber
Topic: 5216 Message: 5216

Hello all,

November 4, set clocks back one hour as Daylight Saving Time officially ends at 2 a.m. and we return to Daylight Standard Time.

Make sure your computer operating system is updated as well. This can cause problems with time stamps in auto imported Time and Date in FLMSG messages and your email messages, too.

Hope to see you all on the paNBEMS nets at the right time tomorrow!

Here's a note from n2nov from NY and a very pertinent statement from a prominent doctor in NYC regarding our seemingly endless debate and concern over HIPPA during emergency and disaster communications.

-Dave, KB3FXI

----- Forwarded Message -----
From: Charles J. Hargrove <n2nov@...>
To: NBEMSham@yahoogroups.com
Sent: Tuesday, November 6, 2012 4:37 PM
Subject: RE: [NBEMSham] Re: NBEMS during Sandy ?

And this from a doctor in our group who is a department head of a major NYC hospital:

I agree with Alan that this situation seems to be a gross overextension of the intended purpose of HIPAA. But I would add that this type of HIPAA panic question is likely to arise in situations where it might be impossible to have timely access to an "authority" on HIPAA who could definitively clear up the question. And, during a disaster there might be times when someone might WANT actual potentially-protected health information to be transmitted. As physicians are able to disclose protected information to third parties with a patient's written permission, disaster relief communications workers should be able to protect themselves (if they perceive such protection to be necessary) by getting a signed disclosure authorization.

Since the original poster on this topic actually requested the information to be transmitted, there would seem to be a de facto disclosure authorization in place, but if disaster communications workers are concerned about these issues, or the possibility of an unintended third party intercepting a communication, then a simply-worded disclosure authorization should be protective. In my opinion this is excessive, and I would not myself be concerned about wasting time with even more paperwork in a disaster, but if someone is really worried about this, it should be easily addressed by using a disclosure authorization.

5219. Olivia vs Contestia for Net Check Ins and Keyboard Chat

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-06 23:31:33 UTC
From: David Kleber
Topic: 5219 Message: 5219

Hello all,

I had a great test with wb0kgn on 40m 7.0725 USB today.

Earlier this afternoon, the path was pretty weak between us but we had a nice chat under poor conditions with Contestia 16/500. Then, a bit later, 40m started going long and we did a good test with FLAMP.

We have been giving some consideration to moving to Contestia for our paNBEMS net check ins and keyboard chat. Contestia 16/500 is quite a bit better into the noise than Olivia 8/500 and the same speed. The trade off is that it is all caps and no extended characters, which means we can't use Contestia for FLMSG or FLAMP messages. The advantage would be the better ability to bring in weak stations. Another issue is that paNBEMS has held the 8/500 Olivia standard for so long, and it has worked reasonably well, that we're not sure if we want to make the change.

Our thoughts are to perhaps test Contestia in a comment round following the paNBEMS bulletins during the net.

We'll announce the switch to Contestia in the next paNBEMS Sunday nets after the bulletins and traffic on our next net.

Any comments or questions are welcome... please post them here to the list.

All one has to do (assuming one is in possession of a functional brain and knows how to use it) is to read the HIPAA summary, and it's clearly about protecting HEALTH RELATED information and how its handled by medical providers...

http://www.hhs.gov/ocr/privacy/hipaa/understanding/srsummary.html

Who Must Follow These Laws

We call the entities that must follow the HIPAA regulations covered entities.

Covered entities include:

Health Plans, including health insurance companies, HMOs, company health plans, and certain government programs that pay for health care, such as Medicare and Medicaid.

Most Health Care Providers—those that conduct certain business electronically, such as electronically billing your health insurance—including most doctors, clinics, hospitals, psychologists, chiropractors, nursing homes, pharmacies, and dentists.

Health Care Clearinghouses—entities that process nonstandard health information they receive from another entity into a standard (i.e., standard electronic format or data content), or vice versa.

I dont see nothing in here about volunteer radio operators providing updates for H&W (which are "patient" volunteered information anyways)....

Like the man said, somebody needs some training!

Thanks for the update on the chart, Ian.

BTW, I successfully sent that file (35k) with 5xPSK250R to a station in NY this afternoon with FLAMP!

TX time was about 8 minutes and followed by a 38 second resend with FLAMP to fill in 4 missing blocks.

Pretty cool stuff!

Dave and all,

Super Dave ! I listened to the ARRL webinar today and Harry had a very nice presentation on nbems for over an hour. FLAMP is really neat I think.

Ok, Rolan...

I'm glad the webinar went well. I let my ARRL membership lapse, so I didn't get a notice.

Was there any discussion on FLAMP? Harry didn't seem to be a big fan of FLAMP initially.

http://www.atldiv.org/training.htm

Check the site... N3LRR usually gets the CD's available for purchase pretty quick. They're only about $7 and some change, which just covers the cost of production and shipping.

Dave,

FLAMP was mentioned but time constraints was such that Harry had to bypass some stuff to demo FLMSG. It’s interesting how fast an hour goes when one is answering questions and trying to demo the basic FLMSG function of FLDIGI.

I’m glad the ARRL is recognizing these modes as ecomm modes of communications.

5231. Today's paNBEMS HF nets

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-11 19:16:44 UTC
From: David Kleber
Topic: 5231 Message: 5231

Hello all,

We had 10 check ins on 3.583 USB this morning and 23 on 7.0725 USB.

Special thanks to KB3PCY for bringing traffic and info on the Chester County NBEMS net.
 According to his report, they had 17 folks show up to their "Tech Rally". The FLMSG plain text view of his file is below.

We did a test with a 4.5k file on FLAMP and PSK-250R which went well according to a few stations who gave reports.

After the net, about 4 of us did some testing with FLAMP and some of the high speed modes with good success.

Anyone interested in FLDIGI testing with the high speed modes can now get the FLDIGI alpha (current version as of right now is still 3.21.59EXP05) at:
http://www.w1hkj.com/alpha/fldigi/v3.21/

(the exe version is for windows and the dmg version is for mac)

FLAMP is now a standard release available at:
http://www.w1hkj.com/download.html

Feel free to drop a line to the list here if you have any questions.

Sent: Thursday, November 15, 2012 1:43 PM
Subject: [NBEMSham] fldigi / flmsg / flamp updates

http://www.w1hkj.com/

fldigi - version 3.21.61

ARQ server
* Changed to multiple client model

flmsg - version 1.1.29

MODES
* Corrected modes table to include BPSK-125, BPSK-250, BPSK-500

Socket interface
* Changed to always open socket connection

HICS-213
* Correct cosmetic errors in html/text reports
* Add missing filed 6c to reports

flamp - version 1.0.01

MODES
* Correct PSK500 to BPSK500.
* Add BPSK125, BPSK250

ARQ mod
* Update to ARQ code

Drag-N-Drop
* Added tx_queue file drag-and-drop target

Menu Folder
* Added menu item "File | Folder" to assist technophobic users

Tx Queue deselect
* clear transmit file fields if no selection made in tx queue

Repeat Critical
* Allow user to specify number of times critical header info is
repeated (independent of # retransmissions)
- <FILE

- <SIZE

Documentation update
* Higher resolution images
* Html primary document

NBEMS users should update their installations to these three applications.

73, Dave, W1HKJ

Dave,

Certainly not your fault and no disrespect intended but the 797 exchange as well as the 782 exchange was not able to make or receive any phone calls additionally the cell phones and internet were out as well. Although I shouldn't laugh because it certainly isn't funny but how was someone supposed to contact Knox EMS station by calling 797-1263 and the Fire Dept. at 797-5000 both are in the 797 exchange. Service came back around 4:30 pm Thursday afternoon. It was out from about 9:30 am. Probably hams should have been deployed to these locations and other emergency facilities like hospitals or to the 911 center in Clarion to provide relays of emergency traffic.

Yep... you're 765 miles from my location... not the best conditions for NVIS.

Virginia was a bit stronger here today than usual on the net. She's 693 miles from me.

I wish we had more regional nets and some big gun stations to act as liaison and relay stations.

We're never going to get wide area or intercon stuff going without the latter.

REMINDER-
Please remember that ALL reports relating to SET or Public Service activities by ARES must be submitted directly to Steve Ewald if you are seeking credit from the ARRL. The directions are on the bottom of the official ARRL forms. Monthly reports are also compiled by ECs and SECs. This helps all ARES units achieve the credit they deserve for drills.

I have listened to a lot of your files and also others.
The area I find that may be a problem is the Receive and Transmit DSP on the Transceivers.

All DSP function should be OFF Some radios have rcve DSP and they should be 0db of off
The transmit should also be neutral 0db or off
I have heard some with the processor on, it almost sounds as an echo.

Tnx de Skip

Good point, Skip.

Compression on transmit will really overdrive the audio and cause a lot of problems.

It's a good idea for any NBEMS stations running sound card interfaces that use your computer sound card to go to Control Panel and see if there is an icon in there for your computer sound card (not necessarily the OS sound). Look for advanced settings and try to find and disable any and all audio processing. It may be labeled as "effects, noise reduction, stereo simulation, etc. Look for these settings under the speaker or playback settings. Some of the higher end sound cards have these processing settings and when they hear unexpected sounds from digital modes, they try to limit what the sound card interprets as unwanted noise. Also, disable all noise reduction on receive or record settings in the sound card.

The nice thing about the USB Signalink is you have none of these worries because it is its own sound card and you don't have to disable your OS sounds.

Rick,

That looks like a permissions issue with your computer OS.

I have not used rig control for a very long time... sorry I can't be of more help. I do know a lot of folks have had good luck with RigCat but you have to get the XML definition file separately for that option, as I recall.

If we don't get any answers for you here, you can post to NBEMSham list where all the programmers hang out.

5259. Thor Revisited

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-21 21:18:46 UTC
From: David Kleber
Topic: 5259 Message: 5259

Info on Thor mode:
http://w1hkj.com/FldigiHelp-3.21/Modes/index.htm

Double spaced in the specification for Thor 4, 5 and 8 means that the tone separation is doubled. DominoES and Thor are both incremental multi-frequency modes and decoding is based on the difference in frequency between consecutive tones and not their absolute frequency (as in MFSK).

Both DomnioEX and Thor are immune to mis-tuning and are thus excellent choices for net activity. This was recently tested by turning off RSID and purposely setting the spot on the waterfall at +100 above the sending station's signal and produced perfect copy.

The original decoder design for DominoEX was identical to the gMFSK implementation. It did use AFC and behaved more like an MFSK decoder. Murray Greenman, the originator of DominoEX, pointed out that there was a better way to decode. With his guidance W1HKJ changed the decoders in both DominoEX and Thor. That was about 3 years ago (2009-2011).

While in Thor mode, the AFC setting in FLDIGI is disabled and this iliminates any issues with receiving stations' spot on the waterfall drifting during overs and subsequenty missing text on the following transmissions.

MultiPsk uses an AFC system and probably does not enjoy the tuning intolerance.

HRD "borrowed code" from fldigi. It's code base is probably about 2 years out of sync with fldigi. So we cannot say whether or not the DM780 part of HRD is tuning intolerant.

paNBEMS plans on conducting some testing with Thor this winter. We had initially discounted Thor and Domino for their very tight tolerance in the tuning spot on the waterfall, but about 3 years ago w1hkj made major changes to the modem and decoding scheme that allows for a wide tolerance in the tuning spot and perhaps even better decoding of weak signals, and in an narrower bandwidth as compared to Olivia.

20m seems to be the biggest challenge for NBEMS. I'm now looking forward to doing a few different types of NBEMS tests there with Thor to see if we can improve our weak signal performance on the non-NVIS bands.

The first test would be just to try to get enough folks on to do some keyboard to keyboard and maybe some small FLMSG files. I'm thinking of either Thor 8, 11 or 16 for that test.

The test I'm even more interested in, is to try Thor 8 with a short plain text file in FLAMP with maybe 5 or 6 repeats to see if we can at least get out some very basic info to a wide area on 20m. I'm guessing the transmission time would be about 20 minutes or so with a very short, basic message.

Lastly, we may give some consideration to using Thor 8 or 11 as our standard checkin/keyboard mode for the paNBEMS nets and may start testing by doing a comment round on some of the upcoming 80m and 40m Sunday paNBEMS nets as a test. If all goes well with Thor 8 or 11, we may consider switching from Olivia 8/500 to Thor 8 or 11 for our keyboard

to keyboard and checkins. The reasoning behind this consideration is that Thor 8 is 28wpm and Thor 11 is 40wpm vs 30wpm on 8/500 Olivia and has a shorter FEC delay and may do better under weak conditions. All the Thor modes are also perfectly suitable for FLMSG and FLAMP.

I'll post the schedule and frequency here when we firm up our test schedules for Thor testing. It should be an interesting to see how we do. We will test Thor on this Sunday's NBEMS nets during a special comments round, but we will continue using Olivia 8/500 for our initial check ins.

Thanks and I hope you can all jump in on the testing... BTW, FLAMP with the FLDIGI EXP Alpha high speed modes continues doing extremely well and is really starting to garner some attention.

Get on the air and have some fun testing!

5260. Re: [paNBEMS] Thor Revisited

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-21 23:55:07 UTC
From: Steven Heimann
Topic: 5259 Message: 5260

Thor11 is the k2k mode of choice for our weekly WICEN HF nets here in NSW, Australia. I initially chose DominoEx8 precisely because of its tuning and sound card error tolerance. A few months or so ago we switched to Thor11 because we had a few weeks in a row of high QRN (plenty of static crashes) and Thor's FEC improved copy significantly while retaining DominoEX's advantages . More recently we have successfully used Olivia 8/500 in conditions where not even Thor11 could cope. The slower speed was frustrating so Olivia 8/500 will probably only be reserved for occasions when nothing else works.

We do have one slightly annoying problem though which might differ from one of David's remarks

On 22/11/12 08:18, David Kleber wrote:
>
> <snip>
> While in Thor mode, the AFC setting in FLDIGI is disabled and this
> iliminates any issues with receiving stations' spot on the waterfall

> </snip>
>

Our problem relates to stations chasing each other up or down the band. If say one station (A) transmits a little low, when they transmit every other station moves down to that frequency. The next station is then transmitting on that lower frequency. When we get round to station A again they transmit low and everybody else moves down again. After a few rounds the whole net can drift down 30Hz or more. I don't understand how this gels with David's remark that AFC is disabled in Thor. Perhaps the retune happens during the RSID.

I have tried solving this by selecting Lk on my station but every received RSID turns Lk off again. We generally run all stations with both RxID and TxID on. This allows easier mode switching for Flmsg and Flamp. As net control I try to remember to periodically manually drag the waterfall center back up to 1500Hz when I transmit. I originally thought this problem was restricted to DominoEX and Thor but it seems to happen for all modes. I think my confusion may have been because not all modes have RSID enabled. Any suggestions on how to manage this, or how other net controllers manage this, would be appreciated. Perhaps there is a configuration setting I have missed.

Regards
Steven VK2BOS

Steven,

I think the general rule is, and should be, that everyone follows NCS.

When I am checking in on a net, I center on the NCS signal and turn off RxID/RSID.

When I am running as NCS, I run RSID on transmit only, and assume that it is the check ins responsibility to follow me. Sometimes, when I'm running a net, a check in will be off a bit on the waterfall. Before I come back to acknowledge, I will often put out a 5 second "tune" marker tone and then advise the check in that they were either low or high from my spot.

I'm not sure how I missed the boat on the change on Thor regarding tuning. I was amazed after a short test the other day. I'm leaning toward Thor 8, with the double space signaling for better performance on weak signals. Thor 8 is 28wpm. We've been doing quite well with 8/500 for our check ins at 30wpm but we often have to do relays to get the weaker stations in, which takes more net time than the trade off on the speed of modes.

In any case, I'm looking forward to working Thor a bit more and sharing the experiences here. I'd encourage others to do the same.

I'll be interested in comparing notes with your experience in Thor and QRN. We're out of our thunderstorm season here now, so it may be a while before we can put Thor to the static crash test.

Thanks, Steven, for jumping in with your thoughts.

Subject: Re: [paNBEMS] Thor Revisited

Thor11 is the k2k mode of choice for our weekly WICEN HF nets here in NSW, Australia. I initially chose DominoEx8 precisely because of its tuning and sound card error tolerance. A few months or so ago we switched to Thor11 because we had a few weeks in a row of high QRN (plenty of static crashes) and Thor's FEC improved copy significantly while retaining DominoEX's advantages . More recently we have successfully used Olivia 8/500 in conditions where not even Thor11 could cope. The slower speed was frustrating so Olivia 8/500 will probably only be reserved for occasions when nothing else works.

We do have one slightly annoying problem though which might differ from one of David's remarks

On 22/11/12 08:18, David Kleber wrote:
>

Our problem relates to stations chasing each other up or down the band. If say one station (A) transmits a little low, when they transmit every other station moves down to that frequency. The next station is then transmitting on that lower frequency. When we get round to station A again they transmit low and everybody else moves down again. After a few rounds the whole net can drift down 30Hz or more. I don't understand how this gels with David's remark that AFC is disabled in Thor. Perhaps the retune happens during the RSID.

I have tried solving this by selecting Lk on my station but every received RSID turns Lk off again. We generally run all stations with both RxID and TxID on. This allows easier mode switching for Flmsg and Flamp. As net control I try to remember to periodically manually drag the waterfall center back up to 1500Hz when I transmit. I originally thought this problem was restricted to DominoEX and Thor but it seems to happen for all modes. I think my confusion may have been because not all modes have RSID enabled. Any suggestions on how to manage this, or how other net controllers manage this, would be appreciated. Perhaps there is a configuration setting I have missed.

That's why as NCS I stick to one spot on the waterfall and turn off the RxID.
The non-NCS stations leave their RxID on for when we switch modes. This way
the NCS becomes the standard that everyone else matches to.

Several have made a similar suggestion and thanks to all.

It will require a change to NCS operations as in our case mode switches (for file transfers interspersed between k2k) don't always come from NCS. I'll try it next week and see how it goes.

Re the tune signal: We have found a tune signal from the transmitting station for everyone to manually lock on to prior to an Flamp/Flmsg transmission very helpful for decode accuracy with the new, high speed modes such as our new favourite PSK125RC10.

Re Olivia 8/500 for k2k: I thought 30wpm would be fast enough given that our group are all poor typists (me included). However, many in the group are preparing messages while others are transmitting (me included) which means the slower modes definitely slow down the net. Something running around the speed of DominoEX8 seems to fit the bill. This is much faster than I expected would be required for k2k. Olivia 8/1000 worked quite well for us last Monday in fair conditions.

And finally back to the topic - Thor: I am pushing out to Thor16 next week to compare to Olivia and to try and get our speed back for k2k. I will let you know how it goes.

Thanks and regards
Steven

p.s. (and O/T) Just for information I note that we have been testing a another free program called Easypal for image transfer. I don't know if this might be relevant to your role with your served agencies. It is quite flexible and, as a digital transfer, receiving stations receive the image exactly as sent. Files of any arbitrary resolution can be sent and this can be adjusted on the fly to control transfer times. It does require fair to good propagation and more power than Fldigi modes. We find it superior to the image mode within MFSK both in speed and quality. It also allows for partial retransmission to fill in missing blocks. Unfortunately it only runs on Windows and seems quite resource hungry. I can only run Fldigi and Easypal one at a time or decode accuracy suffers badly. It will definitely become part of our toolkit.

5264. Re: Thor Revisited --- Synchronizing Center Frequencies

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-22 14:05:44 UTC
From: elancki
Topic: 5259 Message: 5264

I have also had problems chasing down the waterfall during a QSO. I thought it might be because my sound card wasn't calibrated, but that doesn't appear to be the case. I have re-calibrated several times, and the problem remains. the Lk button is useless, in this situation, since it is undone by the next RxID.

Maybe FLDigi could add a "Synchronize" feature to its repertoire. This would be a special RSID that NCS would send to identify the center frequency on the waterfall. FLDigi in all of the receiving stations would automatically QSY to align their their waterfalls on exactly the same audio frequency. Of course, this would not help when using VHF FM.

An alternative might be to have the "Synchronize" RSID automatically adjust the "Calibrate->Audio->Settings->TX offset" in the receiving FLDigi, to correct for misaligned center frequencies.

In either case, one button click on the part of the NCS would automatically align all receiving stations.

One issue no one has talked about yet, make sure the sound cards are calibrated, it might help with some of the waterfall differences.

From: David Kleber
Topic: 5259 Message: 5267

Ed,

If you're chasing everyone down the waterfall, it's almost certainly a calibration problem on your side. The WWV calibration, that is often recommended over CheckSR.exe for being more accurate, only lets you calibrate the receive. But if your TX is off, I'm still not clear how you adjust for that unless you get on the air with another station who you know has both RX and TX corrections made properly.

CheckSR.exe, as long as you run it for your native sample rate, and run FLDIGI in your native sample rate, will give you the figures for both RX and TX corrections to add to FLDIGI and will get you well within the target of +/- 1% or less. Here's where you can download CheckSR.exe:
http://groups.yahoo.com/group/paNBEMS/files/Utilities/

and here's a video:
http://www.youtube.com/watch?v=-1wZ7uIA-Qs&feature=youtu.be

(only run CheckSR.exe for about a minute or so - this is an old video and I advised 3-5 minutes but 1 minute we have found now to be the best)

To check your sound card native sample rate, go to FLDIGI, Help, Audio Device Info. Make sure that if you run Checksr, that's the sample rate you set, and make sure that FLDIGI is also set to that rate. If you run CheckSR, just let it run for about 1 minute, stop, then record the tx and rx correction figures. Then enter those figures in FLDIGI Soundcard Settings.

If you're doing the WWV method, you're going to have to find someone on the air who can assure you that their TX is correct, then you will have to use trial and error by adding different figures in your TX FLDIGI sound card correction box to eventually get lined up with the other station. If you're not running windows, you're stuck with the WWV method... Checksr does not run on linux or mac.

If the majority of the stations you chat with are not walking, but only a few are (as is the case at my station), you are most likely properly adjusted and the other occasional stations that walk are not.

Lastly, the USB Signalink is dead even at 44100, so you can go to FLDIGI, make sure your set to the USB Signalink default sample rate and leave the correction figures at zero.

Morning All

I am sure David has way more experience at this than me but I have never had much faith in CheckSR. If I run it 3 times I get 3 different results. Some people advise to run it for just a minute or so and others to run it for an extended period. I have tried all of the above with variable results. WWV seems to give me repeatable results so I now stick with it.

I know it is breaking cross posting rules but here is a recent email from Dave W1HKJ on the NBEMSham list.

I followed this procedure and now feel I have a station that is spot
on. I think it also has the advantage of automatically correcting a
possible variation in the rx/tx frequencies in the transceiver. We
found one member of our group who seemed to have this problem.

From: David Kleber
Topic: 5259 Message: 5271

Steve,

In defense of CheckSR.exe... let's put things into perspective.

I just ran three, one minute tests with CheckSR on my internal computer sound card. Here's the results:

	TX	RX
1)	44109.46 Hz / 215 PPM	44129.12 Hz / 660 PPM
2)	44119.96 Hz / 452 PPM	44122.61 Hz / 512 PPM
3)	44123.96 Hz / 540 PPM	44126.48 Hz / 600 PPM

Let's take the highest and lowest figures and subtract the difference between the two. The variance on CheckSR is:

TX	RX
14.5 Hz / 325 PPM	6.51 Hz / 148 PPM

The ultimate goal is to have the sound card calibration to less than 1% off. On a 44100 Hz sample rate sound card, this would be +/- 410 Hz. I think this variance in the highest and lowest readings of CheckSR on my sound card is around .03%. And it can be done without having access to an HF receiver in one minute for both RX and TX.

5272. 20m 2pm - 4pm ET, Nov 23, 14.065 USB, 1000 Hz center waterfall

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-23 19:09:54 UTC
From: David Kleber
Topic: 5272 Message: 5272

I'm monitoring and putting out occasional cq's on 14.065 USB, 1000 Hz center waterfall with RSID on and transmitting my cq's with Thor8 and 8/500 olivia from 2pm ET (1900z) to 4pm ET (2100z) today.

At 4pm I will transmit a Thor 8 FLAMP short message file bulletin with 3x repeat.

Jump on and put out a call if you're available. I'm very interested in testing between Olivia 8/500 and Thor8.

All,

I did put out a cq on Thor 8 about 1545 or 1550 and I did get only a few characters after 1600 while on Thor 8 that looked like and sounded like Thor but the short and the short of it,
the band wasn’t open to me here in Md.

Take care,

Ok, Rolan... thanks for trying.

Mixed results so far on Olivia vs Thor8. A station in NM reported 100% on FLAMP with Thor and poor results on the same test with 8/500 olivia... Station in AR from here in Pittsburgh reported better copy on Olivia 8/500 and I confirm the same on our qso... NM station was monitor only so no way to judge from 2-way qso.

One thing I keep coming to the conclusion of is.... until we get a boat-load of modest stations on 20m and/or a handful of big gun stations to help with relays, NVIS 40m day and 80m eve/early morn seem to be the bread and butter bands for emcomm.

20m is just hit or miss... not a good formula for emcomm. Same thing goes, from my experience, on 30m.

We'll continue the testing and I'll probably get a few more reports from the test today. Despite some disappointment, these are all good tests.

I think you are probably correct Dave, in fact 17M might be a better choice due to QRM that exists around 14065 whenever there is a major RTTY contest. A reasonable way to test 20M propagation's at least might be to use the Winmor servers and see how that goes . I suspect that Flamp activity at speeds above basic Olivia will not be substantially different than Winmor on 20M. So, while NBEMS FLAMP may be a better process, Winmor servers that already exist could be used to test typically 20M propagation.
Andy

My opinion,

Point to point comm is always the victim of propagation, that’s where relay stations, multi band operability, nets and training come in.

A reasonable way to test 20M propagation's at least might be to use the Winmor servers and see how that goes . I suspect that Flamp activity at speeds above basic Olivia will not be substantially different than Winmor on 20M. So, while NBEMS FLAMP may be a better process, Winmor servers that already exist could be used to test typically 20M propagation.

Dear all,
If you have general coverage rx that is great! I don't, I have the Omni V and all the band mixing osc are xtal (bummer but ok) and I only have 500 kHz segments +/- 30 kHz.
WWV signals are 5, 10,15, 20, 25 and 30 mHz so I use the 30 meter band for the below tests and the foreign broadcasts for the 40 meter band.
If you want to see how the sound card ppm works you can try this.
With fldigi running call up configure > sound card> settings and remember where the rx ppm is set and then enter 0 there and save
Tune in a carrier from one of the above suggested frequencies and using upper side band or lower side band set tone to 1000 cycles on the water fall.
If you are on lsb the radio frequency dial should read 1000 hz above the received carrier frequency, usb the radio frequency dial should read 1000 below the received carrier frequency.
Regardless of the dial reading, say it is off 40 hz, set the tone to 1000 hz on the water fall.
Then enter 50000 into the sound card configuration rx pmm setting, then save and the water fall should move up 50 hz, if you enter –50000 in the rx pmm window the tone on the water fall will move down 50 hz, so , this is just to show you the sound card works and 50 ppm out of 1000 hz is 50 hz. or , 1000 X .05 (which is 50 ppm) is 50 hz.
Now, before you forget it, enter in the rx pmm to what it was before you started experimenting and click on save.
Whatever band you check find the dial reading for 1000, or what ever frequency you want for both upper and lower sideband, and note the differences. On 40 meters, on a foreign bc, on 7305, for a 1000 hz wf signal, I read 7.304.02 on lsb and 7306.01 on usb so my radio is about 10 hz high on rx.
On 30 meters, for a 1000 hz tone on the wf, 10 mHz reads 10.000.94 on lsb and 9.998.95 on usb so my dial is about 60 hz high.
You can check several 7 mhz foreign broadcasts as they are usually on 5 khz spacing and CHU canada is 7850 khz .
I think the above is plenty accurate to see how accurate your radio dial is, probably within 5 hz easily.
Assuming all the oscillators are the same for generating the tx signal then all the rf frequencies should be the same and the audio to your mic input from the computer will contain the necessary info for all these digi modes to work but sending a 1000 tone to someone whom you just zeroed in on rx at 1000 hz on the wf should let you know your tx is on with your rx, even if your receiver may be off freq a bit.
Also, since most radios tx cw on the dial frequency, tx a cw tone with your dial set 1000 higher than the operating frequency you were working at and the other station should see a 1000 tone on their water fall. If you have a spare transceiver and dummy load it makes things easier to cross check.
I usually key on Dave's or net control signal for center water fall and the two outside markers on tx are really nice.
Hope I didn't bore you but I think the above is an easy way to check your radio frequency accuracy.

Let me know if I made any mistakes or if you have any questions. I find it hard to believe that any of these modes we use won’t handle 20 hz off freq but compared to the previous generation radios that kind of stability was practically impossible so we are really working with tight tolerances.

From: n2phi
Topic: 5281 Message: 5281

Anyone using the FT-950 with the FLDIGI/FLRIG Software. I have been trying for weeks to get the radio to communicate using the software with no luck. I even tried using the ham radio delux. I cannot get the radio to receive or transmit using any software. I recently downloaded the FLRIG in hopes it would work with that but no luck. So if anyone who is using a FT-950 Yaesu would like to assist me in trouble shooting I would really appreciate it. You can email me at n2phi@... . Thank you.

Ed,

Your a genius, that worked. I didn't delete the file as suggested but I did change the settings in the rig and I hit the initialize button. I think that was what I didn't do the last time, hit the initialize button to get started. Thanks, I will try to chime in and participate if possible. Thanks again.

> Ed,

> I am using the most recent version and I am using a USB/Serial adaptor.

> Rick

First thing is to delete your current flrig.files. Depending on your
version of windows it will be found here

On XP C:\"Documents and Settings\<urlogin>\flrig.files\"
On W2K C:\"Documents and Settings\<urlogin>\flrig.files\"
On Vista/Win7 C:\User\<urlogin>\flrig.files\

In the 950 menu make sure these are the settings you are using.

#26 38400

#28 0n

Start flrig, select the 950, set the baud to 38400 and select the com port the adapter is connected to. Click the red init (top right).

If that does not work, you will need to check and make sure you have a driver loaded for the adapter.

For those of you who aren't running in the CW contest today, please jump on 10.135 USB, 1500 Hz center waterfall and put out a call in Olivia 8/500 or Thor8. I'll be monitoring there and putting out an occasional call up to about 6pm ET.

At 3pm, I'll transmit a FLAMP test file in Thor8. Please post your rx reports on the FLAMP/Thor transmission here on the list.

For those on the list who are CW'rs, good luck in the contest.

The 11_24_12_Thor8_short.txt @ 20:03Z came through apparently clean in Fldigi but Flamp 1.0.01 didn't see it. I quit and reopened Flamp. The file was then listed in the receive Queue but no blocks were caught.

I'm in Lenoir NC and am receiving on a 40m NVIS dipole at 8 feet.

On the second send at 20:13Z, I received the 2nd and 3rd blocks.

On the third send at 20:18z, the first lines weren't clean and Flamp didn't see anything.

Ok, Irv... if any data is missed in the header, FLAMP won't act. Maybe there was some missed characters in the header. But I would suspect that the Thor8 mode should have given you 100% unless I was really light copy or you had some heavy noise or qrn there.

We're finding that FLAMP is really bullet proof on a decent NVIS path to stations within 200-300 miles.

5290. paNBEMS nets tomorrow - need NCS volunteer

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-24 22:10:11 UTC
From: David Kleber
Topic: 5290 Message: 5290

Hello all,

I'm going to be unavailable to take the paNBEMS nets tomorrow.

Would someone be so kind as to take the duties for tomorrow. Please let me know here if you can help out.

-Dave, KB3FXI

paNBEMS weekly HF Net starts at 10:00 AM local time every Sunday morning with Net Control call on 3.583 MHz USB using 8/500 Olivia, 1500 Hz center waterfall frequency. After any traffic is passed on the net, we may proceed by sending an MT63 1k long (1000 Hz, 64 bit long interleave) bulletin broadcast message, experiment with different modes or NBEMS alpha products. At approximately 11am ET we switch to 7.0725 USB, Olivia 8/500, 1500 Hz center waterfall, for a retransmission of our weekly bulletin followed by propagation testing and a call for additional stations.

Topic: 5292 Message: 5292

I was trying to copy the net this morning. It seem as if the band conditions are not good. However I was not decoding anything, even on a stong signal. I think it was K3UK. The print looked as if it was a compressed mode. The RXid was not working. Then he switched to MT63 and I copyed everything 100%, after manually switching modes. He then anounced that he was going back to Olivia 8/500, once again no copy.

I was using a differant radio (FT817) and audio coupling. I have done this before and had no problems. To make the story short and maybe help someone else, the only problem was that the noise blanker was ON. After turning it OFF everything copyed again.

Hope this helps someone else. It is simple but easy to over look.

Thanks very much, Andy. I greatly appreciate you picking it up this morning.

I was in and out of the shack just for a few minutes before I had to leave the house at about 11am. I copied your bulletin and most of the check ins. I switched up to 7.0725 USB to monitor while I was gone. It doesn't look like there was a formal net on 40m but a few folks were there chatting, so at least we didn't miss the sked altogether.

Thanks to all who checked in today. Please consider volunteering as NCS. We need some more folks to back us up. Drop me a line if you're interested in taking a turn as NCS for paNBEMS.

Thanks again, Andy!

In my old NTS Net days, our net manager frequently emphasized the need for people to pick-up the net when the assigned NCS does not show for whatever reason. She stated "any one" can pick-up the net if they feel comfortable. So, I will reinforce Dave's message and encouraged others in PA to pick it up when Dave goes walkabout. You PA folks don;t really want a New Yorker running your net, do you ?

5299. NBEMS software updates

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-11-26 18:46:18 UTC
From: David Kleber
Topic: 5299 Message: 5299

Hello all,

W1HKJ is wrestling with some crash issues of FLDIGI with FLMSG and some other transmit issues relating to FLAMP. I helped nail down a bug with N2TIF this morning on 40m in the latest bug fix vs of the FLDIGI alpha 3.21.62EXP02.

I would expect some new releases with fixes sometime in the next week or so, on the standard releases as well as on the alpha's.

Please be patient... W1HJK is doing amazing work on NBEMS and delving into functionality and capabilities that we've never had before. And, he has to port and test all of the software over 3 different computer operating systems. Even if he were producing just basic functionality for keyboard chat, like the other programs out there, it would be a handful. But W1HKJ is dealing with tasks like handling different extended characters, various character sets and trying to assure that checksum and porting functionality all works correctly between the various apps in the NBEMS toolset.

Once we get the next alpha's tested and have some stable versions, I'll post to the list here and on the nets for the recommended upgrades.

Subject: Bandwidth - Narrow and Wide?

For what it's worth, here are my thoughts on our selection of modes and bandwidth.

Narrow and Wide bandwidth are relative terms... on HF, I would consider 1k or more to be wide. Your 4G cell phone uses scalable channel bandwidths of 5–20 MHz, so I suppose if you were close to the tower, your 5 Mhz wide wide signal would be considered narrow in the 4G world.

In spite of the fact that we can run up to about 2.4k on the HF digital allocations (with the exception of 30m which is 500 Hz or less - I think), we generally stick with 500 hz or less for keyboard to keyboard. On HF during our nets, alpha testing or in emergencies where we send larger messages and files, we try to stay under 1k and only switch to a mode like MT63 1k long or 5xPSK125R if we know the spot is clear.

On FM, we're all burning about 4.5k worth of usable audio bandwidth even if we key up with no audio. I've found the best modes for relatively clean paths (near full quieting) to be 10xPSK125R and 12xPSK125R (these modes are still only available in the FLDIGI alpha at http://www.w1hkj.com/alpha/fldigi/v3.21/). For a poorer path on FM, 5xPSK125R and MT63 2k or 1k long work great.

On HF, it is my opinion that we should extend the general rule regarding power (to only use the minimum amount of power needed to carry on your communications) to bandwidth... to only use the minimum bandwidth necessary to carry out the task at hand. The vast majority of folks on HF are doing keyboard chat... why would you run a wide/fast mode that you can't even keep up with when your typing? Or, on an NVIS path, why would you run a 2k wide olivia mode?

It's just kinda common sense and common courtesy.

I found this info from the Digitalradio Yahoo Group:

The following broadcasts (later tonight) of "DXers Unlimited" on Radio Havana include two transmissions of the Olivia 8/500 digital text mode.

This schedule is from http://www.worldofradio.com/dxpgms.html . All times Zulu (UTC)....

0214-0223v Havana: DXERS UNLIMITED 5955 6000 6165
0314-0323v Havana: DXERS UNLIMITED 5955 6000 6165
0414-0423v Havana: DXERS UNLIMITED 5955 6000 6165
0514-0523v Havana: DXERS UNLIMITED 6270 6165 6125 6060 6010 5955
0614-0623v Havana: DXERS UNLIMITED 6270 6165 6125 6060 6010 5955 5040

Thanks for mentioning this Dave. I'll tune in to see what it is.

RHC is one of my favorite shortwave stations to listen to because they do programs focused on shortwave broadcasting, amateur radio, and propagation. In addition to that, their signal is super strong and can be picked up with my Sangean shortwave receiver and it's aluminum telescopic antenna with ease.

Every now and again they throw in a little propaganda, but it's not too bad.

The files section in the Digitalradio Yahoogroup has a recording of the
broadcast for you to use in Fldigi . Remember the days when we would
write to broadcast shortwave stations asking for a copy of their schedule ?
Now they send a printable copy via Fldigi !

Hi Dave,

I've been having a ball receiving these digital transmission over the shortwave am broadcasts. Kim, KD9XB, announced this one today and a station in Bulgaria last night. It's like a secret message coming from a radio broadcast :-)

Here's what I received tonight from the station from Havana. "6VRY RYRY.This is an Olivia 8/500 digital text mode test. . It is a very rugged fading resistant mode, it can be decoded using the FLDigi software. Send your reports to inforhc at enet dot cu 73 and DX from Arnie Coro host of Dxers Unlimited....." I like how they start with the RTTY sync signal ry. It's also cool that they give credit to Fldigi. That's good publicity. Last night was the first time that I used the audio capture feature of Fldigi and it worked pretty good. I was able to record the audio from the station and play back the digital part and decode the text.

Andy,

I imagine the Havana station is ran by the government so I guess it's
really not a commercial station.

On the other hand if they used Fldigi to create the message maybe they
owe W1HKJ some royalties :-)

Hi Geoffrey,

That's pretty cool. It just goes to show you that you don't need a lot
of sophisticated equipment to receive the digital modes. With a radio
and acustical coupling anyone can partipate in any kind of emergency
communciations event.

The Bulgaria shortwave station was using RSID and it did a good job
setting up the mode and spot on the waterfall. Radio Havana didn't have
RSID on so it had to be set up manually unless it was recorded.

Ron,

HRC was dead center on 1000 Hz waterfall, which was where I made my lucky guess as to where they would be. And on AM broadcasts, just like on FM, radio frequency tuning just brings the signal in clearer but doesn't change the spot on the waterfall like tuning the rig VFO does on SSB.

Dave,

Good point on the tuning of AM/FM signals versus SSB. Good way to review the behavoir of signals is to watch the waterfall and tune the signals. I also guessed at 1000 Hz and it was dead on. The Bulgaria station sent out 2 digital signals at once and 1 had RSID. I was actually set on 1000 Hz and it switched to the 2200 Hz with RSID. It was a good demonstration of RSID.

0514-0523v Havana: DXERS UNLIMITED 6270 6165 6125 6060 6010 5955

I'm going to try to shoot for a video capture from FLDIGI on 6.165 MHz AM of the next HRC Olivia transmission at 12/03/12 0514z.

If I get it, I'll post a youtube video tonight and put out a message to the email lists here with a link..

I used Flmsg on The Mighty KBC, via Bulgaria, 9450 kHz, Saturday night (UTC Sunday). (They let me have a couple of minutes for text experiments.)

Audio as received is in the files: KBC_digital_modes_021212.mp3

There are two text transmissions. The first has PSKR125 centered at 1300 Hz, and MFSK32 centered at 2200 Hz.

Some jingles and music, then the second: MFSK32, centered at 1500 Hz. This one is in Flmsg format. When I listened live, the transmitter in Bulgaria opened a new window on my browser.

Thanks, Fred, for posting your comment on the youtube video.

If you check the video again, you'll see that Josh replied to both yours and my comments.

I also got an email exchange going with Josh from my message on his show's website through the "contact us" form.

I offered to act as a technical advisor, or do a phone interview, on NBEMS.

I would encourage everyone to pop on the youtube link (http://youtu.be/vAL_7gh9hbU) and leave Josh Tolley an encouraging comment as well as a short plug for NBEMS.

5322. More digital text via analog shortwave broadcast this weekend

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-06 16:53:05 UTC
From: kd9xb
Topic: 5322 Message: 5322

Digital text via analog shortwave broadcast will be transmitted again on The Mighty KBC during its UTC Sunday 0000-0200 (EST Saturday 7-9pm) broadcast on 9450 kHz.

KBC is based in the Netherlands but leases a 100 kW transmitter in Bulgaria.

The broadcast is mostly an oldies show (in English), but a minute of digital text will be heard at around 0130Z and just before 0200Z. Featured mode of the week is MT63.

The 0200Z message will be Flmsg formatted, so a transmitter in Bulgaria might open a new window of your web browser.

A Transcontinental NBEMS Digital Networking Event
Because the world as we know it, or as the ancient Myans knew it, is supposed to end on Dec 21, this would be a good excuse (reason) to have an End Of The World (EOTW) vigil. I would like to suggest that on Friday evening Dec 21 all of the various NBEMS nets get their people together and we will watch through the night and see if the sun does come up on the 22nd.

For details on this exercise see the Op-Plan under Files in a folder named "EOTW Event"

Pass the word. FM nets on VHF/UHF are invited also.

5324. Digital text via shortwave broadcast from Bulgaria tonight

From: kd9xb
Topic: 5324 Message: 5324

Here in northern Virginia, The Mighty KBS, 9450 kHz, via Bulgaria, is delivering a signal that is S9 +10 over noise that is S9.

What better conditions to test digital test modes? Coming up at 0130Z UTC (8:30 pm EST) is MT63-1000 (long interleave) centered at 1000 Hz, and PSKR125 centered at 2200 Hz. Just before 0200 UTC (9 pm EST) is MT63-2000 (long interleave) centered at 1500 Hz. This message will be formatted for Flmsg. More information at http://www.kbcradio.eu/index.php?dir=news/detail&id=248 .

Subject: [paNBEMS] Digital text via shortwave broadcast from Bulgaria tonight

Here in northern Virginia, The Mighty KBS, 9450 kHz, via Bulgaria, is delivering a signal that is S9 +10 over noise that is S9.

What better conditions to test digital test modes? Coming up at 0130Z UTC (8:30 pm EST) is MT63-1000 (long interleave) centered at 1000 Hz, and PSKR125 centered at 2200 Hz. Just before 0200 UTC (9 pm EST) is MT63-2000 (long interleave) centered at 1500 Hz. This message will be formatted for Flmsg. More information at
http://www.kbcradio.eu/index.php?dir=news/detail&id=248 .

In CT I'm getting signal and noise between S8 and S9. I can just make out the music and announcements. I have fldigi setup on +1500 with MT63-2000, we'll see if I can decode it here. Lots of QRM and QRN. Sometimes the noise drifts away and the signal clears up.

Hello Paul,
The EOTW NBEMS Net sounds like a neat idea, although it is kind of short notice for spreading the word. 12/21 is only a couple of weeks away. Maybe some media coverage could be employed, to spread the word about the net. I'd imagine that any activity associated with the "End of the World" might attract the attention of the media.

The activities described in the END OF THE WORLD.doc file mostly involve interaction between NCS operators. It might be nice for the individual "check-in operators" to get some feedback on how the EOTW Net is progressing. When each NCS gets an updated CSV from neighboring nets, he/she could transmit it to local net participants, as a bulletin. That way the local operators would see which geographic locations and frequencies are actively involved.

In our area, there are some operators who are experimenting with FLDigi, but don't check into nets. They might be interested in listening to the NBEMS net activity as the night progresses, and may be motivated to check in, at some point.

To facilitate individual operator involvement, I might suggest a few tweaks for the CSV template:

1. Add <Grid Locator> to each local check-in record.

2. Add <NCS Call Sign> and <Digital Mode> to the net summary record. This would help if some operators wanted to try and check into more than one net. It would also indicate when the NCS or Mode changes.

3.Substitute <Frequency> for <band in meters> in each net summary record. This would give individual operators an indication of where NBEMS net activities are on the bands.

If we are all still here on 12/22, this might evolve into an annual "EOTW" event :-)

73,
Ed

> Because the world as we know it, or as the ancient Myans knew it, is supposed to end on Dec 21, this would be a good excuse (reason) to have an End Of The World (EOTW) vigil. I would like to suggest that on Friday evening Dec 21 all of the various NBEMS nets get their people together and we will watch through the night and see if the sun does come up on the 22nd.
>
> Many of the various NBEMS nets are regional, taking advantage of NVIS propagation for their main service area. We have often thought it would be nice to come up with a plan for a transcontinental digital net. But the difficulties with that are numerous, not the least of which is the sheer number of people that would be involved.

http://www.w1hkj.com/alpha/fldigi/v3.21/

THOR high speed updates

* IFK+ Softdecode function for THOR
- dynamically detects CWI and avoids
- can be used for DominoEX also with few mods
- Rx printing is disabled when "File IO only" is selected for
soundcard. Decoder uses puncture in this condition.
* THOR FEC confidence indicator
- Uses the actual path-metrics from the Viterbi decoder.
- Displays next to the S/N in the main dialog.
* Thor EXP modes consolidation
- consolidated into 3 modes (30,60,120 Baud)
- fixed random crash when changing modes
- code cleanups
- FEC confidence calc moved to before return due to squelch
Now properly pulls indication to 0 when squelched

PSK multi-carrier modes

* Waterfall bandwidth markers now show full extent of multi-carrier
instead of single carrier

Bench testing of the new THOR decoder indicates considerable improvement.

Dave

Hi,

is this a UHF simplex net? What modes do you use? I used VHF simplex in the past but we didn't go faster than MT63-1000 even though the link fidelity was excellent. I want to give this another try but with a faster mode.

Thanks and 73,

Sander,

That net runs on the w3yj repeater in Pittsburgh which is located atop the University of Pittsburgh Cathedral of Learning, up about 535' above ground level.

They usually use MT63 2k long but have done some limited testing with the FLDIGI Alpha EXP modes.

I'm becoming more partial to 10xPSK125R for any kind of FM work, simplex or repeaters. As a fall back on a poor path 5xPSK125R is good and if all else fails, it's back to the old work horse, MT63.

de w3fdk, I copied the thor ok and got the refill on a missing block later, block 10 was missing, then I was helping some of the guys on our local repeater with a mtn top echolink and I now have a webinar at 1300 but glad to see all the work being done. All looks very promising at first blush. I downloaded and installed all the latest versions on fldigi, flmsg and flamp when I got home about 1115 this morning so I was busy for a while

I may be around later this afternoon to help if I can.

Take care,

73 de rolan

Cool stuff, Kristoff.

Matt did a good job on his first contact. I was sweating bullets on my first contact. I could remember that my hand was shaking.

Josh Tolley has now done 3 shows with major portions of the show dedicated to amateur radio and I've been in touch with him by email. He's a good guy.

Sent: Friday, December 14, 2012 1:36 PM
Subject: [NBEMSham] Digital text via shortwave broadcast this weekend

Because of poor propagation in many parts of the world last weekend, shortwave broadcaster The Mighty KBC, via Bulgaria, will repeat last week's digital text transmission. This will be during the KBC broadcast UTC 16 Dec 0000-0200Z (Saturday night 7-9 pm EST) on 9450 kHz. At about 0130Z, MT63-1000 (long interleave) will be centered on 1000 Hz, PSKR125 centered on 2200 Hz. (Decode one from your radio, the other from your recording.) At just before 0200Z, MT63-2000 (long interleave) will be centered on 1500 Hz. This second transmission will be an html-formatted Flmsg message.

Also, shortwave broadcaster WRMI, Miami, 9955 kHz, will transmit IDs in digital text modes this weekend. Saturday, 0000 to 2400 EST, the mode will be BPSK63F. Sunday, 0000 to 2400 EST, the mode will be Olivia 64-1000 (requires a custom setting in Fldigi). The IDs are, of course, mostly on the hour and half hour.

5353. Digital text via shortwave broadcast coming at 8:30, 9 pm EST

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-16 00:38:32 UTC
From: kd9xb
Topic: 5353 Message: 5353

Shortwave broadcaster The Mighty KBC, based in the Netherlands but transmitting via Bulgaria, is now transmitting to North America on 9450 kHz (AM mode) and will continue to do so until 9 pm EST).

At about 8:30 pm EST, MT63-1000 (long interleave) will be centered on 1000 Hz, PSKR125 centered on 2200 Hz. Decode one from your radio, decode the other from your recording. At just before 9 pm EST, MT63-2000 (long interleave) will be centered on 1500 Hz. This second transmission will be an html-formatted Flmsg message.

Also, private shortwave station WRMI, Miami, 9955 kHz, is transmitting IDs in digital text modes this weekend. Saturday 0000 to 2400 EST, the mode is BPSK63F (also known as PSK63F). Sunday 0000 to 2400 EST, the mode will be Olivia 64-1000 (a non-standard mode that will require a custom setting in Fldigi). The WRMI IDs are, of course, mostly on the hour and half hour.

We are experimenting with digital text modes via analog shortwave as a possible method to provide information via text when the internet is blocked by disasters or dictators.

----- Forwarded Message -----
From: Andrew O'Brien <k3ukandy@...>
To: NBEMSham@yahoogroups.com; digitalradio <digitalradio@yahoogroups.com>
Sent: Saturday, December 15, 2012 8:44 AM
Subject: [NBEMSham] New NBEMS Net - The Transcontinental Net

A new NBEMS net has been discussed by several hams that are active in regional NBEMS nets , a transcontinental net. It will begin Sunday Decemberr 16th at 1800 UTC and Friday December 21st at 0200 UTC (Thursday evening/night in North America) on 14065 USB , center frequency of 1500 Hz , plus/minus for QRM. The net will be a demonstration project and an evaluation of its effectiveness and usage will occur after 90 days. Hopefully it will prove useful and will evolve in to a transcontinental net that meets daily You are invited to participate and help with the project

Here is the description, undoubtedly it will change as the concept evolves.

Net Mission

The NBEMS Transcontinental Net exists to further the goals of local and regional NBEMS nets . Local and regional NBEMS nets provide training and preparedness skills for the delivery of emergency communications via amateur radio, mostly utilizing digital modes and methods . The methods include sophisticated error prevention processes.

The local and regional NBEMS nets are expected to be the main NBEMS nets involved in most scenarios requiring the provision of emergency communication via amateur radio. This is because most emergency/disasters are local and regional in scope. If you are a member of a local, state, or regional NBEMS net, we encourage you to use the NBEMS Transcontinental Net and affiliate your net with the NBEMS Transcontinental Net

While local and regional scenarios are excepted to be most common emcomm scenario, there exists the possibility that certain incidents my require the transmission of information from one region to another. Therefore, the Radio Assistance Network recognizes the need to establish routine practice and preparation for NBEMS communication across the United States and other parts of the North American continent.

The Radio Assistance Network acknowledges the existence of other effective methods of amateur radio emergency communication including WL2K , PSKmail, and the National Traffic System. However we believe that NBEMS methods provide unique capabilities that could be vital in

an emergency.

One of the goals of NBEMS is the provision of emergency communications that is not Internet dependent, via low powered stations using basic equipment and simple antennas. To accomplish this goal when dealing with transcontinental communication , an effective method of relaying “traffic” is needed . The NBEMS Transcontinental Net will provide a skills building opportunity for radio amateurs that includes the accurate relay of communications. This will include communication using message formats used by emergency agencies like FEMA in the USA , The Red Cross and SATERN in North America. NTS-format messages can be quite an effective method, so NTS-format messages may be included in the net. This net is not an official NTS Net.

Net Structure :

Traffic passed on the net will ‘borrow” some of the NTS concepts. Traffic brought to the net will assumed to be “outgoing” traffic that is leaving a region. Example: The Pennsylvania NBEMS net would not be expected to bring traffic intended for a person or agency in Pennsylvania, since their own net would handle that task. Similarly, New Jersey stations with traffic for an agency or person in Connecticut might use the East Coast NBEMS Net to pass their traffic. However, a station in Indiana with traffic for Arizona would bring the traffic to this NBEMS Transcontinental Net. Training messages intended for any station , continent-wide, will be accepted .

A transcontinental net using low powered stations with basic antennae does provide some interesting challenges. The main challenge will be the fact most stations will not always be able to hear every station in the net. The nature of radio waves, on the selected 20M band, are such that stations within 100-400 miles of each other may be incapable of communicating . There may be other scenarios, example a station In California may hear the east coast of the USA and Canada but not hear the south east states.

Due to this phenomena, the net may use different assistant net control stations to “relay in” stations from different regions. In fact, there will be times where the Net Control Station (NCS) will not attempt to call stations within NCS’ region,. Example; an NCS in New York State will ask an ANCS in Wyoming to call for call area 1, 2, and 3 stations.

A net faced with these propagation challenges will have extended periods of time where net communication is taking place but you may not hear any signals at all. To prevent confusion and accidental multiple calls or “doubling”, This net will have a structured “net clock” that will enable net participants to coordinate the net activities. Here is an example of the net clock, net formally starts at the top of the hour on 14065 USB, 1500 Hz center frequency.

55 to 00 minutes : “Early” check-ins accepted by NCS , any stations NCS hears continent wide.

00 to 05 Net Call Up, preamble by NCS , calls for official Assistant Net Control Stations (ANCS) to Check ..

05-10 (If NCS is East Coast located) NCS Calls for check-ins from Call Areas , 4, 5 ,6, and 7 in USA and Canada. , and any Caribbean nations

10-15 NCS asks a Call Area 6 or 7 stations (usually an official ANCS) to call for check ins from Calls Areas 1, 2, 3, 8 and 9 in the USA and Canada.

15-25 Traffic and Bulletins are passed per NCS direction using FLMSG and or FLAMP. NCS may also ask an ANCS to “repeat” a bulletin if the bulletin is “QST”.

25-30 NCS asks for “late check-in”.

30 Net closes formal net

31-59 Informal net begins . Questions , comments, experiments, training.

If you have traffic for the net , using the above net clock, you will know that your area will not be called for check ins until the designated time for your area. You will know that if you have traffic (or are expecting traffic) traffic passing will not begin until 15 minutes passed the hour.

If you check the net frequency at 05-10 minutes past the hour and hear nothing, the net clock will tell you that call areas 4, 5 ,6 are checking in and you simply may not be hearing them. The net clock will also tell you that a new region is called approximately every 5 minutes , so you may soon begin to hear net activity.

As the net evolves the methods may be revised . At times, the net will “improvise” around the usual procedures due to the unexpected. The ability to improvise is the major asset associated with amateur radio, especially NBEMS.

Good deal, Paul.

That's exactly as I got it too with the FLMSG auto pop up here at my station. I was monitoring 9450 AM, and getting caught up on my email, when suddenly my browser popped up to the exact same view as you got.

It's really cool to see the Mighty KBC using FLMSG. Maybe the ARRL could follow their lead on their Amateur Radio bulletin broadcasts. Perhaps a good first baby step with the ARRL would be to at least get them to use RSID when the switch modes on their digi bulletins.

Dave

Good idea! Hopefully, the entire NTS structure could be used by digital. One advantage over CW\SSB is the nearly 60 (or more) modes available. To make it really like the NTS, checkin could be done by really fast modes, then move folks off to pass traffic. You only need one rep per region. We could see on our screens: K3MIY WB0KGN UP 300 3RN 1. The entire net can be contained within 3000 Hz. Net duration could be 15 mins or less, then do comments. Just a thought from a longtime NTS guy. Happy holidays.

Was out of town all last week again guys so have not had anythime to play radio.
I just got my backpack radio set up and running now, that was my project last week at night while stuck in my Motel room.
Only so far for cw and ssb but will make cables to run via computer.
Set up consists of:

FT-817
HF Packer Amp V.4
Z817 Tuner
Chameleon Hybrid Mini
AT-271B/PRC HF Manpack Whip
Power supplied by 2 PBox Units

I have pretty good coy on kd2do and kd3pcy on 7.0725 MHz
this morning...while they were using 8/500 Olivia. I had not copy with MT63 . Its not that I feel left out, but that I thought it was worth the reminder that MT63 is not the best weak signal mode.

John, It wont show up as a com port. It should show up in your sound devices a USB Audio Codec. Set that as both RX and TX sound devices in FlDigi, and make sure the TX audio in the windows mixer control is set to full, or it will not TX.

It doesn’t show up under com ports in the device manager. Go to a “sound, video & game controller” in device manager and the signalink should show up as a CODEC device. It is important to follow the signalink instructions for setting the audio level start on page 4 of the directions from signalink for setting the levels. I know if you’re a ham you hate instruction manuals but the sound level settings for windows are not at all intuitive !!!

5368. Net Schedule change - 80m Sun net now 9:30 AM ET

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-19 22:47:47 UTC
From: KB3FXI
Topic: 5368 Message: 5368

Hello all,

We're moving the 80m paNBEMS Sunday morning schedule back to 9:30 AM ET. The paNBEMS yahoo group description has been updated to reflect the net schedule change: http://groups.yahoo.com/group/paNBEMS/

We are also still looking for NCS volunteers for both the 80m and 40m net schedules.

I will be posting a new 40m macro set for NCS ops on the Sunday net.

If anyone would like to pitch in and help with NCS duties, please respond here on the list or email me directly at kb3fxi at yahoo dot com.

Thanks.

-Dave, KB3FXI

Thanks very much, Frank.

I just uploaded a new 40m NCS macro set. It is in the file section of paNBEMS Yahoo Group.

Please take this coming Sunday for the 40m net.

Hopefully we'll get some more folks to volunteer and we can work up a NCS roster.

5373. FLAMP testing and Use Case Scenarios

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-20 16:33:19 UTC
From: David Kleber
Topic: 5373 Message: 5373

Hello all,

I've received some questions by email and in conversation regarding FLAMP... most are inquiries along the lines of why we would use FLAMP as opposed to just sending a checksum message with FLMSG.

I had the same questions when FLAMP was first introduced but much has been learned since we started some pretty intensive testing here in PA a few months back with both FLAMP and the experimental high speed modes in the FLDIGI Alpha versions.

So, I'd like to share some use case scenarios with FLAMP and the advantages it has to offer for certain situations.

1) Large Files on VHF/UHF FM (Simplex or Repeaters)

Prior to the introduction of the high speed experimental modes in FLDIGI Alpha versions and FLAMP, we had set a file size limit of about 5-6k on VHF/UHF FM repeaters due to the transmission times and the typical 3 minute time out on most repeaters. But, with FLAMP and using a mode like 10xPSK125R, which is 1100 wpm as compared to our standard mode for FM of MT63 2k long at 200 wpm, we can now easily handle 10k or larger files without compression and even bigger files with compression.

Some common problems on VHF/UHF are drop outs from the sending station into repeaters and doubles. Also, some of the VoIP and even RF linked systems can introduce noise as a result of poor RF link paths, repeater ID's and in the case of VoIP linking we will often see and hear audio glitches as a result of packet loss and the codex compression used in VoIP. All of these audio issues can cause loss of text resulting in FLMSG check sum errors.

FLAMP gives us the ability to send files broken into blocks and with modes like 10xPSK125R, we can send the same FLMSG file, repeated 3 times in about the same time as it would take to send the FLAMP file in MT63 2k long. The result is, the blocks that are missed on the first FLAMP transmission are almost always successfully filled on the second pass.

For a large message transfer with FLAMP on a repeater, we can transmit just one single pass and then let the intended recipient station(s) request fills of any missing blocks, rather than having to repeat the entire message, as would be the case with FLMSG.

2) Large files on HV NVIS

Prior to the introduction of FLAMP and the FLDIGI high speed experimental modes, we typically limited file size of FLMSG messages to under 3k. But now with 4x and 5x PSK125R, we can reliably transfer files up to about 15k, assuming we have a moderate to good HF path and/or relays to move the files to weaker stations.

3) Short Bulletin Broadcast on HF

This is one area in which we want to do more testing. The idea is to try to reach as many stations as possible, over very wide areas, with a short/concise bulletin on the 30m and

20m bands. Using FLAMP and a robust slower mode such as Olivia or Thor, we would send the short bulletin file on a 5 or 6 repeat with FLAMP. The bulletin would be on a schedule and specific frequency and waterfall center call spot. Our thought is, if we just needed to get very basic info out to a wide area, we could send the very short message 5 or 6 times to try to assure that as many stations as possible would copy all the blocks and confirm 100%. An example of such a message might be a net activation, frequency spot and expected net duration.

For those who haven't tried FLAMP or the FLDIGI Alpha high speed modes, please give it a try. I would suggest using the most current alpha versions of each for testing.

FLDIGI Alpha (download and install the "EXP" version for your computer OS):
http://www.w1hkj.com/alpha/fldigi/v3.21/

FLAMP:
http://www.w1hkj.com/alpha/flamp/

And here is the help file for FLAMP:
http://w1hkj.com/flamp-help/index.html

FLAMP is actually easier to set up to receive files than FLMSG. All that you have to remember is that FLAMP must be open and running to receive incoming files. After the file is received and confirmed as 100% in the bottom window of the FLAMP Receive tab view, just click "Save" in FLAMP. To open the file, go to FLAMP, Files, Folders, then double click the saved file.

We're very interested to hear from folks here on the list if you have tested with FLAMP and what kind of results you had from your testing. Please post to the paNBEMS list and not to me privately.

Dave,

I haven’t tested with different modes but I have used it when you were testing and some were done with different modes and following is why I really like it,

Number one 1 !! To me this is important, the operator has to be there in case resends are necessary, an operator present during ecomm is essential if at all possible.

Number two , when receiving you can watch the blocks being filled in, miss one or more and at the end, send a report and see the missing blocks fill in when the operator on the other end responds.

Number three, as Dave said, all kinds of setups as per block size and modes for tx.

Number four, in any ecomm the operators should have some experience with whatever mode they are using and in my opinion once fldigi is set up flamp is probably one of the easiest to learn, for receive anyway, and on a par with flmsg when starting from scratch.

Just a few comments but I really like it for the above reasons. Why ask for fills or a complete resend on flmsg when one can send a report and get only the blocks missed retransmitted to you. AND IT IS DESIGNED FOR FILES !

Take care, I really would like to see flamp be the standard for ecomm.

Also, some of the VoIP and even RF linked systems can introduce noise as a result of poor RF link paths, repeater ID's and in the case of VoIP linking we will often see and hear audio glitches as a result of packet loss and the codex compression used in VoIP. All of these audio issues can cause loss of text resulting in FLMSG check sum errors.

FLAMP gives us the ability to send files broken into blocks and with modes like 10xPSK125R, we can send the same FLMSG file, repeated 3 times in about the same time as it would take to send the FLAMP file in MT63 2k long. The result is, the blocks that are missed on the first FLAMP transmission are almost always successfully filled on the second pass.

For a large message transfer with FLAMP on a repeater, we can transmit just one single pass and then let the intended recipient station(s) request fills of any missing blocks, rather than having to repeat the entire message, as would be the case with FLMSG.

2) Large files on HV NVIS

Prior to the introduction of FLAMP and the FLDIGI high speed experimental modes, we typically limited file size of FLMSG messages to under 3k. But now with 4x and 5x PSK125R, we can reliably transfer files up to about 15k, assuming we have a moderate to good HF path and/or relays to move the files to weaker stations.

3) Short Bulletin Broadcast on HF

This is one area in which we want to do more testing. The idea is to try to reach as many stations as possible, over very wide areas, with a short/concise bulletin on the 30m and 20m bands. Using FLAMP and a robust slower mode such as Olivia or Thor, we would send the short bulletin file on a 5 or 6 repeat with FLAMP. The bulletin would be on a schedule and specific frequency and waterfall center call spot. Our thought is, if we just needed to get very basic info out to a wide area, we could send the very short message 5 or 6 times to try to assure that as many stations as possible would copy all the blocks and confirm 100%. An example of such a message might be a net activation, frequency spot and expected net duration.

For those who haven't tried FLAMP or the FLDIGI Alpha high speed modes, please give it a try. I would suggest using the most current alpha versions of each for testing.

FLDIGI Alpha (download and install the "EXP" version for your computer OS):
http://www.w1hkj.com/alpha/fldigi/v3.21/

FLAMP:
http://www.w1hkj.com/alpha/flamp/

And here is the help file for FLAMP:
http://w1hkj.com/flamp-help/index.html

FLAMP is actually easier to set up to receive files than FLMSG. All that you have to remember is that FLAMP must be open and running to receive incoming files. After the file is received and confirmed as 100% in the bottom window of the FLAMP Receive tab view, just click "Save" in FLAMP. To open the file, go to FLAMP, Files, Folders, then double click the

saved file.

We're very interested to hear from folks here on the list if you have tested with FLAMP and what kind of results you had from your testing. Please post to the paNBEMS list and not to me privately.

Thanks for the comments, Rolan. And thanks for your help in testing and in checking in on the paNBEMS nets.

We're even having good success with unmanned stations receiving the FLAMP messages with the high speed modes. We usually do 2x or 3x repeat and most stations in NVIS range come back to their shack to find 100% confirmed FLAMP files ready to save and view.

But I'm most impressed with FLAMP and the very fast/wide modes on VHF/UHF FM. It's a jaw-dropper!

Subject: Re: [paNBEMS] FLAMP testing and Use Case Scenarios

Dave,

I haven’t tested with different modes but I have used it when you were testing and some were done with different modes and following is why I really like it,

Number one 1 !! To me this is important, the operator has to be there in case resends are necessary, an operator present during ecomm is essential if at all possible.

Number two , when receiving you can watch the blocks being filled in, miss one or more and at the end, send a report and see the missing blocks fill in when the operator on the other end responds.

Number three, as Dave said, all kinds of setups as per block size and modes for tx.

Number four, in any ecomm the operators should have some experience with whatever mode they are using and in my opinion once fldigi is set up flamp is probably one of the easiest to learn, for receive anyway, and on a par with flmsg when starting from scratch.

Just a few comments but I really like it for the above reasons. Why ask for fills or a complete resend on flmsg when one can send a report and get only the blocks missed retransmitted to you. AND IT IS DESIGNED FOR FILES !

Take care, I really would like to see flamp be the standard for ecomm.

Subject: [paNBEMS] FLAMP testing and Use Case Scenarios

Hello all,

I've received some questions by email and in conversation regarding FLAMP... most are inquiries along the lines of why we would use FLAMP as opposed to just sending a checksum message with FLMSG.

I had the same questions when FLAMP was first introduced but much has been learned since we started some pretty intensive testing here in PA a few months back with both FLAMP and the experimental high speed modes in the FLDIGI Alpha versions.

So, I'd like to share some use case scenarios with FLAMP and the advantages it has to offer for certain situations.

1) Large Files on VHF/UHF FM (Simplex or Repeaters)

Prior to the introduction of the high speed experimental modes in FLDIGI Alpha versions and FLAMP, we had set a file size limit of about 5-6k on VHF/UHF FM repeaters due to the transmission times and the typical 3 minute time out on most repeaters. But, with FLAMP and using a mode like 10xPSK125R, which is 1100 wpm as compared to our standard mode for FM of MT63 2k long at 200 wpm, we can now easily handle 10k or larger files without compression and even bigger files with compression.

Some common problems on VHF/UHF are drop outs from the sending station into repeaters and doubles. Also, some of the VoIP and even RF linked systems can introduce noise as a result of poor RF link paths, repeater ID's and in the case of VoIP linking we will often see and hear audio glitches as a result of packet loss and the codex compression used in VoIP. All of these audio issues can cause loss of text resulting in FLMSG check sum errors.

FLAMP gives us the ability to send files broken into blocks and with modes like 10xPSK125R, we can send the same FLMSG file, repeated 3 times in about the same time as it would take to send the FLAMP file in MT63 2k long. The result is, the blocks that are missed on the first FLAMP transmission are almost always successfully filled on the second pass.

For
a large message transfer with FLAMP on a repeater, we can transmit just one single pass and then let the intended recipient station(s) request fills of any missing blocks, rather than having to repeat the entire message, as would be the case with FLMSG.

2)
Large files on HV NVIS

Prior
to the introduction of FLAMP and the FLDIGI high speed experimental modes, we typically limited file size of FLMSG messages to under 3k. But now with 4x and 5x PSK125R, we can reliably transfer files up to about 15k, assuming we have a moderate to good HF path and/or relays to move the files to weaker stations.

3) Short Bulletin
Broadcast on HF

Denny,

I'm on 7.0725 USB today until about 5pm ET. 7.0725 USB, 1500 Hz waterfall center had pretty much become an NBEMS watering hole during the day. We usually put out the initial calls on Olivia 8/500 and then go to 4xPSK125R for FLAMP testing. Just make sure you have the most current alpha versions from the links I provided.

I just started a new job last week and it looks like my days off will be Wed and Thur, for a while anyway.

I'm also available some evenings after 9pm ET.

Subject: Re: [paNBEMS] FLAMP testing and Use Case Scenarios

Dave,

I haven’t tested with different modes but I have used it when you were testing and some were done with different modes and following is why I really like it,

Number one 1 !! To me this is important, the operator has to be there in case resends are necessary, an operator present during ecomm is essential if at all possible.

Number two , when receiving you can watch the blocks being filled in, miss one or more and at the end, send a report and see the missing blocks fill in when the operator on the other end responds.

Number three, as Dave said, all kinds of setups as per block size and modes for tx.

Number four, in any ecomm the operators should have some experience with whatever mode they are using and in my opinion once fldigi is set up flamp is probably one of the easiest to learn, for receive anyway, and on a par with flmsg when starting from scratch.

Just a few comments but I really like it for the above reasons. Why ask for fills or a complete resend on flmsg when one can send a report and get only the blocks missed retransmitted to you. AND IT IS DESIGNED FOR FILES !

Take care, I really would like to see flamp be the standard for ecomm.

Subject: [paNBEMS] FLAMP testing and Use Case Scenarios

Hello all,

I've received some questions by email and in conversation regarding FLAMP... most are inquiries along the lines of why we would use FLAMP as opposed to just sending a checksum message with FLMSG.

I had the same questions when FLAMP was first introduced but much has been learned since we started some pretty intensive testing here in PA a few months back with both FLAMP and the experimental high speed modes in the FLDIGI Alpha versions.

So, I'd like to share some use case scenarios with FLAMP and the advantages it has to offer for certain situations.

1) Large Files on VHF/UHF FM (Simplex or Repeaters)

Prior to the introduction of the high speed experimental modes in FLDIGI Alpha versions and FLAMP, we had set a file size limit of about 5-6k on VHF/UHF FM repeaters due to the transmission times and the typical 3 minute time out on most repeaters. But, with FLAMP and using a mode like 10xPSK125R, which is 1100 wpm as compared to our standard mode for FM of MT63 2k long at 200 wpm, we can now easily handle 10k or larger files without compression and even bigger files with compression.

Some common problems on VHF/UHF are drop outs from the sending station into repeaters and doubles. Also, some of the VoIP and even RF linked systems can introduce noise as a result of poor RF link paths, repeater ID's and in the case of VoIP linking we will often see and hear audio glitches as a result of packet loss and the codex compression used in VoIP. All of these audio issues can cause loss of text resulting in FLMSG check sum errors.

FLAMP gives us the ability to send files broken into blocks and with modes like 10xPSK125R, we can send the same FLMSG file, repeated 3 times in about the same time as it would take to send the FLAMP file in MT63 2k long. The result is, the blocks that are missed on the first FLAMP transmission are almost always successfully filled on the second pass.

For a large message transfer with FLAMP on a repeater, we can transmit just one single pass and then let the intended recipient station(s) request fills of any missing blocks, rather than having to repeat the entire message, as would be the case with FLMSG.

2) Large files on HV NVIS

Prior to the introduction of FLAMP and the FLDIGI high speed experimental modes, we typically limited file size of FLMSG messages to under 3k. But now with 4x and 5x PSK125R, we can reliably transfer files up to about 15k, assuming we have a moderate to good HF path and/or relays to move the files to weaker stations.

3) Short Bulletin Broadcast on HF

This is one area in which we want to do more testing. The idea is to try to reach as many stations as possible, over very wide areas, with a short/concise bulletin on the 30m and 20m bands. Using FLAMP and a robust slower mode such as Olivia or Thor, we would send the short bulletin file on a 5 or 6 repeat with FLAMP. The bulletin would be on a schedule and specific frequency and waterfall center call spot. Our thought is, if we just needed to get very basic info out to a wide area, we could send the very short message 5 or 6 times to try to assure that as many stations as possible would copy all the blocks and confirm 100%. An example of such a message might be a net activation, frequency spot and expected net duration.

For those who haven't tried FLAMP or the FLDIGI Alpha high speed modes, please give it a try. I would suggest using the most current alpha versions of each for testing.

FLDIGI Alpha (download and install the "EXP" version for your computer OS):
http://www.w1hkj.com/alpha/fldigi/v3.21/

FLAMP:
http://www.w1hkj.com/alpha/flamp/

And here is the help file for FLAMP:
http://w1hkj.com/flamp-help/index.html

FLAMP is actually easier to set up to receive files than FLMSG. All that you have to remember is that FLAMP must be open and running to receive incoming files. After the file is received and confirmed as 100% in the bottom window of the FLAMP Receive tab view, just click "Save" in FLAMP. To open the file, go to FLAMP, Files, Folders, then double click the saved file.

We're very interested to hear from folks here on the list if you have tested with FLAMP and what kind of results you had from your testing. Please post to the paNBEMS list and not to me privately.

Thanks for all the info, Dave - things are a little insane around here in recent weeks, but if it ever gets back to normal, I want to get in on this FLAMP testing, too.

I was around for some of the discussions years ago when the forerunner 'AMP' was developed. It followed a model called 'Radio Mirror' and the people at the U.S.PACKET group were behind it. It really kicked into high gear in response to Hurricane Katrina. N5PVL had AMP running on HF for quite a while.

One of the problems perceived in Katrina was lack of a way to send bulletins to multiple shelters at the same time. AMP was designed to retransmit files repeatedly, so that PCs at each location would eventually have copies of the whole file. One thing we talked about using it for was sending lists of people trying to contact their loved ones who might be in shelters. All that would be needed at the shelter was a receiver and a laptop. Has anybody ported this over to Raspberry Pi yet?

Your idea of using it to send regular bulletins is basically the same thing, and probably more practical than having it going continually.

I hope by the next SET - we're planning two of them here next year - we can get enough people using FLAMP to include it in the exercise. Perhaps we'll start each hour with an FLAMP bulletin, followed by live traffic.

How about a bunch of us approach ARRL and suggest that they use FLAMP to send their bulletins? That would give the mode a big, immediate boost.

I'm pretty sure that quite a few folks, besides myself, have suggested that the ARRL just start to try to use RSID on the mode changes for their digi bulletins, but that never happened.

I doubt that they'd consider doing FLMSG or FLAMP... But the Bulgeria shortwave broadcast station has adopted FLMSG.

5387. Digital text via shortwave broadcast this weekend

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-22 10:50:05 UTC
From: kd9xb
Topic: 5387 Message: 5387

European shortwave broadcaster The Mighty KBC, 9450 kHz (AM mode), will transmit to North America tonight (Saturday) at 7 to 9 pm EST. At about 8:30 pm, four digital modes will be transmitted simultaneously. MT63-1000 (long interleave) will be centered on 1000 Hz. MFSK32 on 2000 Hz. PSKR125 on 2600 Hz. And BPSK63 just under 3000 Hz. Just before 9 pm, MT63-2000 (long interleave) will be centered on 1500 Hz, leaving just enough room for PSKR250 on about 2800 Hz. This second transmission will be an Flmsg formatted holiday message, with html.

Today (Saturday), shortwave broadcaster WRMI in Miami, 9955 kHz, is transmitting IDs in MFSK8, centered on 2000 Hz, generally on the hour and half hour. So far I've not had much luck decoding these, but YMMV. Sunday, WRMI will transmit IDs in MFSK16, centered on 2500 and 3000 Hz. I predict more success with those.

An interesting thing about MT63 2k long is that there is a MASSIVE amount of forward error correction in that mode.

I would suspect that even if a station was being intentionally jammed, as long as the station sending the MT63 signal wasn't completely overwhelmed by the jamming station, many folks should get 100% on the MT63 message.

Hi all

I pointed this out to Dave. Using the narrower modes, you can run an
entire NTS-style net in less than 3000 Hz.

5394. Re: Digital text via shortwave broadcast this weekend

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-22 14:29:35 UTC
From: kd9xb
Topic: 5387 Message: 5394

I will try the various flavors of MT63 on WRMI, probably in January.

On WRMI, PSKR125, MFSK16, BPSK63F, and especially Olivia 64-1000 all cut through or sidestepped the noise pretty well.

Today's MFSK8 on WRMI is not particularly successful. Tomorrow's MFSK16 centered on 2500 and 3000 Hz should do better.

MT63-2000 performed well (depending on the listener's location) on The Mighty KBC via Bulgaria the last two weekends. It did not have to contend with QRM, just a fair-to-poor signal strength and some fading. There will be more MT63-2000 tonight just before 9 pm. The transmitter in Bulgaria might open a new window of your browser.

> > European shortwave broadcaster The Mighty KBC, 9450 kHz (AM mode), will transmit to North America tonight (Saturday) at 7 to 9 pm EST. At about 8:30 pm, four digital modes will be transmitted simultaneously. MT63-1000 (long interleave) will be centered on 1000 Hz. MFSK32 on 2000 Hz. PSKR125 on 2600 Hz. And BPSK63 just under 3000 Hz. Just before 9 pm, MT63-2000 (long interleave) will be centered on 1500 Hz, leaving just enough room for PSKR250 on about 2800 Hz. This second transmission will be an Flmsg formatted holiday message, with html.
> >
> > Today (Saturday), shortwave broadcaster WRMI in Miami, 9955 kHz, is transmitting IDs in MFSK8, centered on 2000 Hz, generally on the hour and half hour. So far I've not had much luck decoding these, but YMMV. Sunday, WRMI will transmit IDs in MFSK16, centered on 2500 and 3000 Hz. I predict more success with those.

5395. Re: EOTW Vigil now in progress --- Frequency?

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-23 13:26:57 UTC
From: elancki
Topic: 5383 Message: 5395

The usual frequencies for the NY-NBEMS and PA-NBEMS nets are 7.036 MHz. NBEMS FLAMP exercises are generally held on 7.0725 MHz. K3UK had proposed using 14.065 MHz for the EOTW net. I spent Friday evening scanning those three frequencies for any net activity.

The day after the net, I received an e-mail from the Yahoo group stating that KB3FXI had been taking check-ins on 3.583 MHz. There might have been a few more check-ins if the net frequency or frequencies had been disseminated a few days before the net.

5397. Todays Transcontinental Net on 14.065

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-23 19:37:47 UTC
From: wb0kgn@q.com
Topic: 5397 Message: 5397

I felt pretty cocky/ confident of my abilities in using FLdigi and FLmsg and in my (untested) ability to relay. I am a little more humble now. I was requested to relay a message which I had not received error free. I tried to fix it. I probably should have just asked that it be re-sent.

I am grateful for the opportunities the net presented me with today.

From: Andrew O'Brien
Topic: 5398 Message: 5398

I know it may be no big deal to most , but it really amazed me to see how well Flmsg works with Fldigi. Today when that EOTW net report popped up on my screen in beautifully formatted columns from an original CSV file, I was simply amazed!

All messages on my end opened up 100% with no errors, but you are correct Dave , it is a learning experience and why we should learn and practice with the software, relaying and all that goes with it. We do loads of exercises on VHF here in Thunder bay, not sure of activity in your neck of the woods in MN but it is a great tool, if I was not on the road so much I would be playing daily again….like before….

Good job today and was glad I could pre-check in between decorating the tree and getting ready for the BIG day, so remember the reason for the season…

Cheers Gang

Exactly Dave, the net provides an opportunity to discover a few things. I learned a lot about things I need to get better at. But the main thing is Dave, we could communicate with each other.

Subject: [NBEMSham] Yahoo group usage

Good evening user groups,

I am a regular listener and often contributor to the three yahoo
groups that support the various software applications that I and
others have created and maintain. The membership in the three
groups at my last count are:

* linuxham - 1731
* NBEMSham - 1288
* win-fldigi - 1402

I am sure that many of you are members or at least monitor the activity on two or all three of the groups. The goals of the three groups are:

linuxham

Support group for W1HKJ software (www.w1hkj.com). Ham software for Linux. All programs distributed under the General Public License. Please consider joining the NBEMSham group for Windows support of all of the W1HKJ products, or win-fldigi group for support of fldigi. This group also supports OS X users.
>

NBEMSham

Narrow Band Emergency Messaging System. This group is dedicated to installation, support and testing issues associated with the NBEMS software suite. This software suite consists of: fldigi, flarq, flmsg, flamp, flwrap, and flrig. These programs area available for the following operating systems: Linux, Puppy, OS X, XP, W2K, Vista, Win7, and Win8

>

win-fldigi

This group was set up in 2008 by G3VFP purely to support Windows users of this multi mode digital software originally developed for Linux, and ported to run within Windows.
>

It has been a pleasure to be a member of these groups. I would like to wish you all Happy Holidays and the best for the New Year. There is some new and exciting development being done on fldigi, including high speed modems particularly well suited for VHF/UHF SSB and FM transmission. The development and testing of these high speed modems is now complete and it only remains for me to complete the integration and documentation (both user and developer) for these modems. I can also tell you that work has started on a Stanag 4285 modem type.

73, Dave, W1HKJ

Subject: [SATERNSouth] Christmas Greetings

It is the sincere hope of all of us here in the Southern Territory, that you have a joyous and merry Christmas. We would be remiss if we did not take a moment to reflect on the reason for this holiest of holidays in the Christian tradition - the birth of Jesus. This celebration of His birth should be a time of reflection over the past year and commitment of purpose for the new year.

In the coming year, the SATERN leadership of the Southern Territory is looking forward to the renewed efforts of our ham radio community in providing faithful and dependable communication when and where it is needed in the service of the Salvation Army Emergency Communications ministry.

To do that, we believe that God has touched the hearts and lives of those who volunteer their time to train with us on the SSB Net Saturday mornings and the Digital Net at NOON on Saturdays.

This special interest Yahoo! Group is but one of the ways we are reaching out to hams of all interests and inclination. We hope to bring you more information and training that will help you better understand our mission and serve those in need when an emergency strikes our nation or abroad.

We need people just like you. You are needed in many ways. Both the digital and SSB nets are looking for volunteers who will act as leaders by taking a Net Control Station operation no more than once a month. If you are that person, contact either Southern Territory SATERN Coordinator Bill Feist, WB8BZH or Southern Territory SATERN Net Manager AD5XJ Ken with an email. If you have thoughts and ideas you would like to share with us, drop an email to Bill Feist, WB8BZH or Ken, AD5XJ. We welcome your ideas and suggestions to help improve or response to emergencies next year.

If you would like to know more about the SATERN organization, got the the official web site www.satern.org. If you would like to become a member of the SATERN organization, there is a link there to apply for membership.

May God bless you in your efforts in the coming year and God Bless America!

AD5XJ Ken
SATERN Southern Territory Net Manager

5407. Winter Weather reports / 7.0725 USB

Topic: 5407 Message: 5407

Hello all,

I've been putting out digital bulletins on 7.0725 USB, olivia 8/500, 1500 Hz center waterfall with NBEMS FLMSG (no other stations heard yet but I suspect that several stations are monitoring and will get the reports when they return to their stations).

Here's my next report for Noon ET:

KB3FXI, O'Hara Twp., Allegheny Co, PA
12/26/12 Winter Storm log (EST)

08:36 - PIT (Pittsburgh International Airport) has been deicing aircraft
09:50 - sleet to snow
10:30 - deteriorating road conditions
11:00 - widespread vehicle accidents reported via public safety
radio throughout Allegheny Co
11:20 - 2 in accum.

###

Feel free to jump on the clear spot and give your reports.

Also, here's the reporting criteria for calling into your local NWS for winter storm reports:

SNOWFALL After 2 inches of new snow, and then at 4 inches, 6 inches, and every 3 inches thereafter (e.g., 2, 4, 6, 9, 12, etc.)

FREEZING RAIN As soon as you observe the occurrence of freezing rain or freezing drizzle, especially if it starts to collect on objects. Call again if the glaze/ice accumulation exceeds 1/4 inch

THUNDER SNOW Location and time of occurrence

WIND SPEEDS Report wind speeds greater
than 40 mph

Happy Day after Christmas everyone!!!

FYI rain/snow mix has turned to all snow in the eastern part of Allegheny County. Dave H. and Dave K. are we monitoring nets?

Hello Dave Kleber and the group,

One thing that would be good for the typical local club member of 70 yrs of age (I'm only 54 and can handle computers, Fldigi/NBEMS, and Linux) is a simple, stable version of the NBEMS suite with no bugs that we can get everyone to use, and we won't have issues of constant upgrades to newer version required to keep everyone on the same page.

We have guys using Digipan because it is simple and doesn't keep changing!

Eric,

If you have a club or net manager, you can settle on any NBEMS/FLDIGI version and put on the breaks at any time.

Yours is a common comment/complaint on NBEMS... that there are too many updates and occasional problems with new releases. But, an even more common complaint on other programs such as UI View for packet and MixW (which was $49) was that there were rarely, if ever, improvements or updates made to those applications.

W1HKJ is moving forward with some extremely innovative and valuable functionality that no other free software offers. With this innovation comes the trade off of regular updates and occasional bugs.

I guess we just have to take the good with the bad. So far, in my opinion, we've got a lot more good than bad from W1HKJ and the NBEMS software.

We're probably going to see a big new update on NBEMS in the next few months with the addition of the current Alpha experimental high speed modes which will be sure to be a major game-changer in digital amateur radio emcomm.

My hats off to the guys who are working so hard to update, upgrade, add to, and fix the inevitable bugs and glitches that are to be expected when trying to develop programs to run on not only different OS's but different radio equipment and interface packages. I agree with Dave, find a version you like and use it until something newer and out of Beta comes along that you want to try, keep the version you have incase the new one doesn't do what you want it to do so you can go back to the old one without any problem. If you to try the newest still in test version don't gripe about something that doesn't work correctly, that doesn't help anyone. Ask the developers what they need to see to be able to work up a fix for a problem or problems and above all be PATIENT, software development takes time, energy, dedication and one heck of a lot of trial and error. I, for one, greatly appreciate all the development team is doing for all us other hams so that all we have to do is click on an icon, fill in a few settings (usually just one time for the standard info) and "HERE'S JOHNNY", and it works. Oh, I almost forgot, just think about sitting down and writing the HELP files alone and keeping that updated.

And that's all I've got to say about that. Happy New Year one and all 73 de;

From: "Skip" KAUFFMAN
Topic: 5390 Message: 5413

Holiday Greetings to all,
I am changing the Freq of the 10 meter Digit Net to
28.1188 mhz 1500 center
Now, the reason, has been a busy DX freq for the last couple of weeks
The PropNet group also uses this freq

The purpose of the digi net is to get more Tech class licenses to
participate in HF digi communications
I have abt a 50 radius that I can hear.
However, there is plenty of DX near this freq that may entice the use of 10
meters

Skip

Thanks for posting information on your 10 meter NBEMS net in Potter county. Your post caught my interest because we, Chester County ARES / RACES is beginning to hold weekly NBEMS sessions on 10 meters following our regular weekly NBEMS net on our 446.525 repeater. We think 10 meter ground wave will gives us county wide coverage if we loose our repeater network. ON January 12 we will be conducting a 10 meter ssb field exercise with stations deployed to some Chester County townships and we are also encouraging those that cant get out and set up with a portable station to join us with their home stations. We are hoping for participation from several of the adjacent counties and would invite your gang as well but I doubt we will have any propagation between us. Your too close for sky wave and too far for ground wave. I will post the details of our 10 meter Tech Rally in another e-mail just to let others know what we are trying to accomplish.

Thanks,

Joe K3JV Chester County ARES RACES EC

5415. January 12 10 meter NBEMS Tech Rally

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-27 20:14:45 UTC
From: Joe Vilardo
Topic: 5415 Message: 5415

The following is a group e-mail from http://www.w3eoc.org/.

Subject: 10 M NBEMS Technical Rally

Time: Saturday morning Jan 12 9.00-11.00 AM.

Purpose: Test the local coverage across Chester and adjacent counties for select NBEMS modes on 10 M. CCAR needs to continue to test and expand infrastructureless ways to transmit digital information using the FLdigi software suite. This should be a fun and relaxed way to expand our horizons.

Location: 10 M NCS will be located at the EOC room 026 using the 10 M antenna and radios. Participants may be at home, mobile, or at a strategic county site i.e shelter site, township bldg, High school. Mobile participation is highly encouraged to further vet portable capability amongst the participants.

Software: Please be advised to have the latest experimental versions of FLdigi, FLmsg and FLamp since we will also want test high speed mode transmission.
FLDIGI EXP - http://www.w1hkj.com/alpha/fldigi/v3.21/
FLMSG Alpha - http://www.w1hkj.com/alpha/flmsg/
FLAMP - http://www.w1hkj.com/alpha/flamp/

Antenna system: Be creative and experiment! It is anticipated that groundwave is the propagation mechanism.
.
Agenda:

1. To make best use of time at the Tech Rally Please send a confirmation of participation email to kb3pcy@email.w3eoc.net and cc k3eui@... with the following info:
1. Location
2. Power
3. Antenna type i.e horizontal or vertical

2. Repeater Check in on 446.525 (PL 100), 446.175 (PL 100), 146.940 (PL 131) at 9:00 am. We will seek check ins in adjacent counties as well.

3. Switch to 28.400 Mhz at approx 9:15 and take voice check in as first test of 10 M propagation. NCS will prompt

4. NCS will transmit a short msg on 28.400 followed by roll call request of reception reports from the field. This will be a modest file on MT 63 2k.

5. After mapping voice reception reports from the EOC to the field, NCS will request messages from field locations with traffic in mode of choice by caller. This is where participants can get creative apnd push the envelope a little with higher speed modes, different types off files, FLAmp , etc.

6. We will then give everyone a chance with criteria being reception at the EOC. However we would like to get feedback later of all files received by everyone to get the full view of propagation vs mode.

So please keep a log and send it to either kb3pcy or k3eui after the exercise!!!

See you Saturday Dec 12 Any questions pls email myself or Barry

Sounds like an ambitious and interesting exercise Joe! I'll be very interested to hear the results afterwards and look for forward to your report. Just for grins I'll tune to the assigned frequency and see if I can hear skywaves in CT though that's doubtful.

Good luck,

Sander W1SOP

One point about steps 4 & 5: Data transmissions are only permitted below 28.300. It sounds like you are planning to do your digital messages in the voice subband, You might want to review that. 10 meters is unfortunately segregated like that.

Dana

Thanks for your comments. I looked at the IARU region 2 band plan and it allows data above 28.300 to 28.900 as long as it doesn't exceed 2700 HZ occupied band width. I also checked out the ARRL band plan and "considerate operator guide" which indicates data below 28.000-28.300. Is the considerate operator guide a suggestion for good practice and not a FCC rule? Then I went to the FCC rules and one chart shows data below 28.300 and also a comment about band width not exceeding 500 HZ. Are we restricted to bandwidth less than 500 hZ and below 28.300 by the FCC ? Is the band plan for 10 meters by the IARU worthless for US operators?

The language is a bit confusing. I would appreciate any comments?

Joe

Subject: Re: [paNBEMS] January 12 10 meter NBEMS Tech Rally

One point about steps 4 & 5: Data transmissions are only permitted below 28.300. It sounds like you are planning to do your digital messages in the voice subband, You might want to review that. 10 meters is unfortunately segregated like that.

The following is a group e-mail from http://www.w3eoc.org/.

Subject: 10 M NBEMS Technical Rally

Time: Saturday morning Jan 12 9.00-11.00 AM.

Purpose: Test the local coverage across Chester and adjacent counties for select NBEMS modes on 10 M. CCAR needs to continue to test and expand infrastructureless ways to transmit digital information using the FLdigi software suite. This should be a fun and relaxed way to expand our horizons.

Location: 10 M NCS will be located at the EOC room 026 using the 10 M antenna and radios. Participants may be at home, mobile, or at a strategic county site i.e shelter site, township bldg, High school. Mobile participation is highly encouraged to further vet portable capability amongst the participants.

Software: Please be advised to have the latest experimental versions of FLdigi, FLmsg and FLamp since we will also want test high speed mode transmission.
FLDIGI EXP - http://www.w1hkj.com/alpha/fldigi/v3.21/
FLMSG Alpha - http://www.w1hkj.com/alpha/flmsg/
FLAMP - http://www.w1hkj.com/alpha/flamp/

Antenna system: Be creative and experiment! It is anticipated that groundwave is the propagation mechanism.
.
Agenda:

1. To make best use of time at the Tech Rally Please send a confirmation of participation email to kb3pcy@... and cc k3eui@... with the following info:
1. Location
2. Power
3. Antenna type i.e horizontal or vertical

2. Repeater Check in on 446.525 (PL 100), 446.175 (PL 100), 146.940 (PL 131) at 9:00 am. We will seek check ins in adjacent counties as well.

3. Switch to 28.400 Mhz at approx 9:15 and take voice check in as first test of 10 M propagation. NCS will prompt

4. NCS will transmit a short msg on 28.400 followed by roll call request of reception reports from the field. This will be a modest file on MT 63 2k.

5. After mapping voice reception reports from the EOC to the field, NCS will request messages from field locations with traffic in mode of choice by caller. This is where participants can get creative apnd push the envelope a little with higher speed modes, different types off files, FLAmp , etc.

6. We will then give everyone a chance with criteria being reception at the EOC. However we would like to get feedback later of all files received by everyone to get the full view of propagation vs mode.

So please keep a log and send it to either kb3pcy or k3eui after the exercise!!!

See you Saturday Dec 12 Any questions pls email myself or Barry

5420. Re: [paNBEMS] January 12 10 meter NBEMS Tech Rally

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-29 03:41:34 UTC
From: David Kleber
Topic: 5415 Message: 5420

Here's what I've always gone by, which I believe dates back to rule changes in 2007 or 2008, whereby Techs were given data privileges on 10m (previously only CW in limited areas) and extended phone privileges:

http://www.arrl.org/frequency-allocations

10 Meters
Novice and Technician classes:
28.000-28.300 MHz: CW, RTTY/Data--Maximum power 200 watts PEP
28.300-28.500 MHz: CW, Phone--Maximum power 200 watts PEP
General, Advanced, Amateur Extra classes:
28.000-28.300 MHz: CW, RTTY/Data
28.300-29.700 MHz: CW, Phone, Image

To the best of my knowledge, the only bands below 2m that we can mix phone (voice) and digital (up to 2400 or 2700 Hz wide) are 60m and 160m and I think CW can be worked just about anywhere.

I think any 500 Hz digital bandwidth limits that you might see, within our digital allocations, are gentleman's agreements, usually on the lower parts of the digital allocations. paNBEMS regularly goes up to 1k in the lower digital allocations of several bands, including 40m and 80m, but ONLY when we have a clear spot, and we limit our transmission on the wider modes to relatively short transmission times when we're sending larger messages and data files.

Joe,

I will freely admit to not being a lawyer, but here is how I have read things.

Neither the IARU band plan nor the ARRL operator guide are legally binding on us. The IARU is an international organization and has no legal authority in the US. It makes recommendations that the countries can ignore. The ARRL operator guide is consistent with the FCC rules, and the FCC makes the rules. So I would trust the ARRL guide.

In 97.305(c), the FCC designates 28.000-28.300 as RTTY/Data, and above 28.300 as voice/image. With the exception of SSTV (an image mode), all the sound card modes that I have heard of are considered either RTTY or Data by the FCC.

According to 97.3(c)(2), a SSB sound card data mode is a J2D emission, which would be Olivia, MFSK, MT63. J=SSB, 2=uses audio subcarrier,
D=data

According to 97.3(c)(7), RTTY is a narrow band teleprinting mode (J2B), like RTTY, but also includes PSK31. J=SSB, 2=uses audio subcarrier, B=teleprinting

The 500 Hz limit mentioned for data applies to the A1C, J3C modes, which are fax modes (C=fax). SSTV is a wide band fax mode (2.8 kHz), so it's image, not data.

(Wikipedia is my friend here: http://en.wikipedia.org/wiki/Types_of_radio_emissions)

I am guessing that a RTTY mode uses either single phase shifts or frequency shifts to send text in a binary code, while the data modes use multiple tones to send data. I am not sure why the distinction between the two types is made, but it's their rules.

As I read table in 97.305(c), and the footnotes to the table in 97.307(f), there is no bandwidth limit on 10m for RTTY/Data, but a limit on character rate of 1200 baud. I am not sure whether some of the high speed modes violate this character rate. If so, they would be limited to above 30MHz. Oh, and below 10m the baud rate is limited to 300 baud.

The rules are on ARRL website, as well as www.ecfr.gov, and are hard to read, but they are the rules.

That is my best shot at the interpretation.   Perhaps a chat with the folks at the ARRL would clarify this.

Forward from the Skyview Radio Society yahoo group email list:

Missing North Huntingdon Male (Jacob Lipp)
Fri Dec 28, 2012 10:31 pm

I wanted to make the list aware that the missing adult male from Westmoreland County/North Huntingdon is Steve Lipp's (W3SLL) son. Steve is a long time operator. He assisted me in getting Children's Hospital up and running with HAM operators. Steve also assisted in the recent VE session at Skyview in November.

Please keep your thoughts and prayers for Steve Lipp and family. His son went

missing. This is not a hoax.

http://www.wpxi.com/news/news/local/family-pleads-safe-return-missing-north-hunt\
ingdon/nTgjh/

Steve said that the law enforcement agencies are all over it and that right now all we can do is keep our eyes open in case we see him. He said we can't do anything but hope and pray for his safe return.

5424. Off Topic - A great role model/sports hero

Yahoo group: paNBEMS (2012 — 2018)
Date: 2012-12-30 05:58:41 UTC
From: David Kleber
Topic: 5424 Message: 5424

As founder of paNBEMS, I'd like to pass along an off-topic post to the list about a great American Icon.

This year marks the 40th year anniversary of the tragic death of a great humanitarian, who happened to be a Pittsburgh Pirate baseball player... a true gentleman with whose character was that of loyalty, caring and generosity.

Sports writers, puzzled at his refusal to leave the Pittsburgh Pirates for much higher pay with other teams, asked Roberto Clemente why he refused to leave the Pittsburgh Pirate organization. His response was that the Pirates gave him his first break into Major League Baseball, which helped him give so much back to his community in Puerto Rico, and for that reason he remained faithful to his team and the organization.

On December 31, 1972, the world lost, not only a great baseball player, but more significantly, a great human being.

Please take a few minutes of your time to watch the video on following web page:

http://sports.yahoo.com/blogs/mlb-big-league-stew/roberto-clemente-death-40-years-later-legacy-lives-164102770--mlb.html

Happy New Year to all.

-Dave, KB3FXI

3.21.65

    High Speed / Multi-Carrier Modems

      * This commit contributed to by:
        - John Douyere <vk2eta@gmail.com>
        - Dave Freese <w1hkj@...>
        - John Phelps <kl4yfd@...>
        - Andrej Lajovic <s57ln@hamradio.si>
      * New high speed and multi carrier modems
        - psk, pskr
        - DominoEX
        - Thor
      * Added separate modem initialization for
        Olivia tone / bandwidth pairs:
        - 4/250, 8/250
        - 4/500, 8/500, 16/500
        - 8/1000, 16/1000, 32/1000
        - 64/2000
      * RSID changes
        - Added secondary RsID code set
        - RsID code 263 enables detection of the secondary
          RsID code burst.
      * MFSK UTF-8 tx
        - corrected transmit of two-byte UTF-8 characters
      * PSK-UTF-8 tx
        - corrected transmit of two-byte UTF-8 characters
      * Added separate modem initialization for
        Olivia tone / bandwidth pairs:
        - 4/250, 8/250
        - 4/500, 8/500, 16/500
        - 8/1000, 16/1000, 32/1000
        - 64/2000
      * RSID changes
        - Added secondary RsID code set
        - RsID code 263 enables detection of the secondary
          RsID code burst.
      * MFSK UTF-8 tx
        - corrected transmit of two-byte UTF-8 characters
      * PSK-UTF-8 tx
        - corrected transmit of two-byte UTF-8 characters
      * Changed PSK multicarrier bandwidth markers to show full
        extent of signal in the waterfall.
      * THOR modem updates
        - Added Thor high speed modes
```

```
          25x4, 50, 50x2, 100 Baud, all < 1800 Hz bandwidth
        - IFK+ Softdecode function for THOR
          dynamically detects and suppresses CWI
          Rx printing is disabled when "File IO only" is selected for
          soundcard.  Decoder uses puncture in this condition.
        - THOR FEC confidence indicator
          Uses the actual path-metrics from the Viterbi decoder.
          Displays next to the S/N in the main dialog.

    User configurable items

      * View Browser Colors
        - Added configurable colors to signal view browser
      *Logbook browser font
        - Added set font code for logbook browser

No further work on the code until 3.21.65 is release to the public.

73, Dave, W1HKJ
```

5426. Digital Software Class (FLdigi)

DIGITAL SOFTWARE TRAINING (FLdigi)

AKA: Narrow Band Emergency Messaging System (NBEMS)

?

AKA:??Steve and Steve are Baaack!!

?

WHERE: Maumee Police Station (Second Floor)

400 Conant St. Maumee, Ohio 43537

WHEN: There are two classes…

The first is 9:00 am Saturday January 19th?2013

The second is 9:00 am Saturday February 16th?2013.

?

BRING A 2 METER HT AND YOUR LAPTOP

?

The first class is entry level. Installation of software. Navigating the software program (MACROS). How to transmit and receive. What modes to use. Where do I listen? Even more if you want it and time allows.

?

The second class will be geared to getting those who missed the first class up and running, and then more learning about the MACROS, the MESSAGE FORMS, Getting your interface to work correctly, and how to be involved with NBEMS or just rag chewing.

?

ALL ARE WELCOME! The classes are free.??We will meet next door at Dale’s Bar and Grill after class for those who want to eat and process what we have learned.

?

Contact Steve KC8TVW@... 419-467-3734 or Steve W8TER@... 419-367-1200

?

Talk-in 147.270 + PL 103.5 or 444.700 + PL 103.5 also 146.520

?

Shortwave broadcaster The Mighty KBC is transmitting from its leased Bulgaria transmitter on 9450 kHz (AM mode). Signal is weak but audible here in northern Virginia.

At around 8:30pm EST, a message in Olivia 8-1000 will be centered on 1500 Hz, and MFSK31 on 2500 Hz.

At just before 9 pm EST, an Flmsg-formatted holiday greeting in MT63-2000 (long interleave) centered on 1500 Hz, and PSKR250 on 2800 Hz.

From: Fred VE3FAL
Topic: 5429 Message: 5429

Hello gang:

First off Happy New Year to all.

Just wanted to let you know I am still around but have been busy doing other things and radio time has been limited.

When I have been on I have been playing my favorite mode of cw as a K3Y operator for Straight Key Century Club.

I am also waiting on some new straight keys for my collection and can't wait to operate them.

Teaching starts up again this week and I have 9 weeks in Thunder Bay with a 2 week stint at the end of February in White River.

The YL and I will be off to Varadero for a wedding the week of Feb 11th to 18th.

Been playing lots in the evenings with MARS ALE and WL2K both running and using each other to link via ALE and then send message P2P via WL2K, been working great.

Propagation has not been all that good though as of late.

Also busy changing the shack around and building my portable unit for when I am on the road. The YL got me one of those HPRC (High Performance resin Cases) for Christmas for that purpose, that they are durable, dust and water proof.

So just wanted to give an update for the Daves in case you guys have been looking for me, I am still here.

Green Christmas here in Thunder bay, had rain again yesterday and calling for plus 5 C tomorrow, did a 10km bike ride yesterday as it was so nice out.

I see lots of activity on 14.065 and 40 meters so should not have a problem.

If I see some other VE7's online I will let them know to give you a holler.

Subject: Re: [NBEMSham] Still Around

I thought maybe you got snowed in and the highway to Minnesota was closed. I've got Fldigi sort of running. I've been calling CQ on 14.065 m 1000. As well as 7.072 and 7.065. Nana nothing only on PSK Freq.

I've ordered an MFJ 1622. Apartment / Portable antenna 10-40 m. Starting March 26 in Saskatchewan to Newfoundland I hope to connect with Digital from my hotel room, hope we can meet in Thunderday in March April

Are there and NBEMS hams in my neck of the woods. If you see my call sign on the waterfall let me know. I know my signal is going east as pskreporter says I'm being heard.

Happy New Belated

5436. NCS for this Sunday, Jan 13

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-01-12 03:37:43 UTC
From: KB3FXI
Topic: 5436 Message: 5436

Hello all,

Thanks for the well wishes and kind thoughts on my recent PEMA/ACS Digital Manager Appointment.

And special thanks to N3FLL, Frank, for picking up the NCS duties over the last several weeks.

In my chats with Frank, he agrees that NCS is fun and things fall into place pretty quick, after only a few NCS sessions.

Frank has offered to pick up the paNBMES duties again this week, but it would really be great if someone else might be willing to give it a shot.

You don't have to be in Pennsylvania to take the NCS spot.

Please drop me a line and let me know if you're willing to take the paNBEMS 40m NCS role this Sunday at 11am ET on 7.0725 USB. I can provide the Macro Set and any guidance you need and I would suspect that N3FLL can back you up.

I'll pick up the 9:30am ET 80m NCS duties on 3.583 USB but I have to be out the door by about 11:15am ET for work.

-Dave, KB3FXI

From: Fred VE3FAL
Topic: 5438 Message: 5438

Thought I would forward this as well to a few others if folks wish to monitor.

Fred

VE3FAL

Good morning, all!

In the keeping with SARA's tradition of providing operating opportunities and challenges, we are continuing efforts to organize a weekly digital modes net for interested members and guests. An attempt was made this past fall on 2-meters and while successful contacts were made, participation had been limited, leading to placing the 2-meter version on indefinite suspension.

I am pleased to announce the SARA Digital Net - HF Edition Beta Sessions beginning Sunday, January 13 at 1900 hrs Local. The Net frequency will be 3,580.15 mHz and the mode will be BPSK63. Additionally, we will use the SARA 147.060+ 114.0 Tone as the coordination frequency for the activities on the digital net. A small focus group tested this process out last Sunday on 15-meters and although we determined that 15-meters worked well for most, ground wave propagation was limited and not all stations heard all other stations.

So, here we go:

SARA Digital Modes Net - HF Edition

Beta Sessions

Sundays, 1900 hrs Local (7:00 PM)

Freq: 3,580.15 mHz (80-meters)

Mode: BPSK63

Voice Coordination on SARA Repeater 147.060mHz, + Offset, 114.0 Tone

Looking forward to seeing many of you on the waterfall today!

73 es CUL

de KC0OIO Joe Heitzinger

Vice President - SARA

Digital Net Organizer

5443. VA7DGP and FLDIGI and IC720

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-01-14 02:52:12 UTC
From: Fred VE3FAL
Topic: 5443 Message: 5443

Don and I played for a bit tonight on FLDIGI since he has been having abit of a go trying to get his IC720 and signalink to work for him on FLDIGI.

Don and I have always had a pipeline between BC and Ontario, so tonight I sent a few CQ 's and the local weather to him. He copied me fine with a bit of QSB on both 40 and 20 meters but I had no copy on him at all.

He is running a 130' center fed dipole and running a signalink to the microphone connector on the IC720, he says he has no problem with WL2K working for him on this rig but I should have heard him.

Anyone else running this rig or anyone have any ideas to help Don out?

Cheers

Fred

Fred,

Assuming that Don is getting the Signalink to trigger on TX and the rig in going into TX, have him check the rig meter power out reading to see what kind of power, if any, he's getting out of the rig.

My first guess is that the audio level is too low to the rig mic jack. And, of course, if the Signalink isn't lighting up the TX LED when he hit's tx on FLDIGI, he may not have a high enough audio level drive set to the computer sound card. There is a jumper in the USB Signalink to boost the power out. Have him check that IF the Signalink is actually activating with the red "PPT" LED and the rig in actually going into transmit.

The Signalink is VOX activated by the internal sound card audio settings of the computer operating system sound levels. If he's not getting the transmit light on the Signalink, he may have to raise both the main volume and the wav volume sliders in the OS sound card levels by right (not left) clicking the little speaker icon at the bottom right corner of the windows screen to bring up the full set of volume controls.

-Dave, KB3FXI

Subject: [paNBEMS] VA7DGP and FLDIGI and IC720

Don and I played for a bit tonight on FLDIGI since he has been having abit of a go trying to get his IC720 and signalink to work for him on FLDIGI.
Don and I have always had a pipeline between BC and Ontario, so tonight I sent a few CQ ‘s and the local weather to him. He copied me fine with a bit of QSB on both 40 and 20 meters but I had no copy on him at all.

He is running a 130’ center fed dipole and running a signalink to the microphone connector on the IC720, he says he has no problem with WL2K working for him on this rig but I should have heard him.
Anyone else running this rig or anyone have any ideas to help Don out?

Cheers
Fred

5445. xmit after last flmsg and flamp

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-01-16 19:31:10 UTC
From: Dale Farmer
Topic: 5445 Message: 5445

Last Sunday during the net at least two messages where sent using flmsg and flamp, both on 3.585 and 7.072. After the message was received, my radio started to xmit. No actual signal was sent but the xmit led came on. Has anyone seen this? I have look in the configuration of Fldigi, Flmsg. Flamp is not installed. Is there a quick fix or is it going to be an uninstall and reinstall situation. This a Linux machine with no internet connection.

Subject: [paNBEMS] Flamp 1.0.0AM

The latest Flamp 1.0.0AM has a great new feature,but I couldn't
figure it out at first.
If you miss receiving any blocks of a message you can request just those blocks be resent.
Ask for the specific blocks:ex 4,6,7. The sending station can either type the numbers in
the "blocks" window or copy and
paste them into the "blocks" window.
Be sure there is a comma after each block number except the last number.The missing blocks
show up in the window labeled "missing".
I hope this helpful to someone else.

Please distribute as widely as possible!!!!

COMMUNICATIONS TRAINING OPPORTUNITY ANNOUNCEMENT

The Pennsylvania Emergency Management Agency (PEMA), through the Auxiliary Communications Services (ACS) program will be hosting the following communications training opportunity.

Please read the prerequisites for requesting to attend the courses!!!

This course being provided by the Department of Homeland Security/Office of Emergency Communications Technical Assistance (TA) Program.

SPCL-AUXCOMM – Auxiliary Communications Workshop
Course Date: February 23 and 24, 2013
Location: PEMA Headquarters, Harrisburg, PA
Lodging: Lodging will be provided for the nights of February 22nd and 23rd for attendees who live greater than 50 miles from the training site.
Meals: Working lunches will be provided on each day of training, all other meals will be the responsibility of the attendee.
Prerequisites: All attendees must provide proof they have successfully completed the following:
· ICS -100 Introduction to ICS
· ICS-200 Basic ICS
· ICS-700 Introduction to the National Incident Management System (NIMS)
· ICS-800 Introduction to the National Response Framework (NRF)
· All attendees must also have an Amateur Radio General Class licenses (or higher)
Max. Number of Attendees: 30
Deadline for registration: February 15, 2013
Course Description: This workshop is designed for the amateur radio/auxiliary communications community or group who provides emergency communications backup support for planned or unplanned events at a State/Territory, Tribal, regional, or local level. This workshop is designed for amateur radio operators/organizations and coordination/support personnel with an amateur radio background.

This full 20 hour workshop focuses on educating attendees about auxiliary communications interoperability, emergency operations center etiquette, on-the-air etiquette, FCC rules and regulations, auxiliary communications training and planning, certification and accreditation and emergency communications deployment. It is intended to supplement and standardize an operator's basic knowledge of emergency amateur radio communications in a public safety context.

Send registration info (Name, address, phone, email, agency/organization affiliation, pre-requisite documents) to Chris Snyder at the address below.

Dave,
Don NN8B and myself took the class last Sept. in Columbus and is well worth the time spent. If anyone going has a laptop and flash drive to take with them it would be a great help for the exercise's they will be in.

5453. 40m paNBEMS net control for tomorrow (Sun Jan 20, 2013)?

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-01-20 00:32:14 UTC
From: KB3FXI
Topic: 5453 Message: 5453

Hello all,

As most of you know, I'm back to work and my work schedule has me working Sundays. I have to head out the door by about 11:20am on Sundays to get to work on time.

We need some more volunteers for the 40m paNBEMS NCS duties at 11am ET on 7.0725 USB, 1500 Hz center waterfall. Anyone within reasonable NVIS range of PA can take the net, whether you're in PA or not.

So far, I've only ever had enough other volunteers to count on one hand.

Frank, N3FLL, has done a great job over the last month or so but it would REALLY be nice if we had some more folks step up to the plate.

Please consider contributing to the paNBEMS effort and let me know here on the list or to my email at kb3fxi at yahoo dot com if you would be willing to give NCS duties a shot tomorrow.

I'll be picking up the 80m paNBEMS net at 9:30am on 3.5835 USB.

Thanks.

-Dave, KB3FXI

Subject: [NBEMSham] Digital text soon on (weak) 9450 kHz

Marginal signal tonight from shortwave broadcaster The Mighty KBC, via Bulgaria, on 9450 kHz (AM mode).

Nevertheless, digital text modes coming up soon might be worth a decoding attempt.

At about 8:30pm EST, 4xPSK63R will be centered on 1000 Hz and MFSK64 centered on 2000 Hz.

At just before 9 pm EST, MT63-2000 (long interleave) will be centered on 1500 Hz, and PSKR250 on 2800 Hz. This will be an Flmsg formatted transmission, with html.

My view is that since it is PA net, NCS should be in PA. However, I'm glad to help from NY state, when needed.

From: W1JWN
Topic: 5456 Message: 5456

I have installed FLDIGI on another computer so I can use my laptop mobile for NBEMS... so far I can transmit but I am on 7.073 now... can anyone come on with Oliva 8-500 and see if I am making it? my cell is 413-207-1386

I want to try and use my laptop this morning to work this net mobile too.

Denny,

I checked with Christopher Snyder and this is the only one planned at this time.

I'll forward along any other training opportunities when I get them.

Dave

Is there any chance that these classes might be held around the state?
Maybe use the unuversity system for classrooms?

5459. Digital Bulletin Test - Wed, Jan 23, 2013, 6:45pm ET

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-01-23 18:58:24 UTC
From: David Kleber
Topic: 5459 Message: 5459

Hello all,

I will be transmitting a test bulletin tonight at 6:45pm ET on 3.583 USB, using Olivia 8/500 at 1500 Hz center waterfall. Following the Olivia 8/500 transmission, I will send the same message again with MT63 500 Hz, long interleave. The bulletin will be sent using the NBEMS/FLMSG ICS-213 format.

All are encouraged to copy the bulletin and email your reception reports to kb3fxi@...

The NBEMS software is free to download at:
http://w1hkj.com/download.html

Download the current FLDIGI and FLMSG applications for your computer operating system then follow the directions for FLDIGI configuration with FLMSG at:
http://youtu.be/psP489NOkg0

For those using digital sound card programs other than NBEMS, you will still be able to see the text of the message, along with the additional formatting codes for the ICS-213 format.

Keep in mind that all HF digital ops are on USB, including 40m and 80m, and you do not need a direct wired interface to copy the data. Just have your computer microphone (internal or plug in) near the speaker of your receiver to copy the data. Adjust the volume of your receiver audio so that you see yellow on the display for the olivia received signal and blue for the MT63 signal.

If anyone has any questions, needs help with setup, or would like to schedule a phone call or one-on-one test sked on HF, feel free to email me or call 412-447-1767 (leave a message and I'll return your call as soon as possible).

:s1:6 KB3FXI
:p3:24 PEMA/ACS Digital Manager
:mg:411 Unattended stations can monitor NBEMS call spots for NBEMS digital broadcast
bulletins which can

be used to disseminate critical information in the early onset of an emergency situation. This can help
eliminate the need to repeat basic information on tactical phone nets and help with the coordination of
net activations and frequencies.

Please send your reception reports of this bulletin to:
KB3FXI@...
[WRAP:chksum 0EA6][WRAP:end]
... end

####

Thanks again to all who tuned in and copied the bulletin.

We're considering doing a weekly bulletin on a set schedule and frequency as a way to bring in more folks to digital ops and to disseminate information.

I'll post and additional schedules here on the list and on the paNBEMS nets.

More info on the paNBEMS nets at:
http://groups.yahoo.com/group/paNBEMS/

Feel free to contact me if you need any help in getting the NBEMS software set up. I'm glad to help.

From: KB3FXI
Topic: 5461 Message: 5461

Hello all,

We're still in a building process with the paNBEMS and need more participation in the way of net control station volunteers.

Until we can get at least 3 or 4 folks to pitch in as NCS on a rotation for the 11am 40m paNBEMS net, we're going to switch up the format a bit.

At 11am ET on 7.0725 USB, we will transmit a short bulletin on olivia 8/500 then follow with a more detailed bulletin using FLAMP and FLDIGI, the mode of which will be announced on olivia prior to the FLAMP transmission. This will give new digital ops and lurkers the ability to simply copy the messages.

To copy the FLAMP message, just download, install and open the FLAMP program. FLAMP has to be running along with FLDIGI in order to receive the message files. Make sure you are running the current standard versions of both FLDIGI and FLAMP from http://w1hkj.com/download.html

The goal with the bulletins will be to provide a low-pressure way for ops new to digital to start getting involved. My hope is that we can then get them to take the next step by checking in and bringing traffic to the schedule and then eventually building up our NCS volunteers from there.

Following the bulletins, any of our check ins (within or outside PA) are welcome to stand in and pick up NCS operations.

The 80m 9:30am ET paNBEMS Sunday morning net will remain unchanged with us taking check ins by specific area followed by the passing of traffic and bulletins.

Starting in February, we will start calling stations by PEMA Task Force areas on the 80m paNBEMS net. I will publish the list of PEMA PA Task Force areas by County here on the list and also transmit the list prior to the start of the Feb 80m paNBEMS nets.

Please help spread the word on paNBEMS and I hope to see you all on the waterfall tomorrow.

I'll be taking NCS duty for 80m at 9:30am tomorrow morning and doing the 40m bulletins at 11am ET before I have to head out for work.

Greetings to all,

Please consider changing the paNBEMS net time as it interferes with church services. I would like to participate however church begins at 0930 to 1230 EST and 6 PM Sundays, and Wednesdays at 7:00 PM EST. Anyone else have dates and times? Please let me know as I would like to be part of this net.

From: <rolan.clark@...>
Topic: 5461 Message: 5464

Dave and all,

I really like FLAMP, just click on report for the information needed to send for refills for to confirm the data. I noticed this morning on 40 mtrs several stations missed different block so whom ever sent the original msg has only to resend the entire msg again. It took two ‘refills’ but it was nice to see all the blocks filled.

I think this is really nice program and can only get better. I imagine on vhf it is probably mostly 100% most of the time.

Also if anyone wants to experiment with EASYPAL to send pictures maybe we can set up a good path on 40 or 80 mtrs sometime. I would like to be able to use this program. I can receive but not sure if I’m tx correctly. I have one person here locally who is trying to get his radio to interface properly and then we can experiment more but I think EASYPAL may be a good ecomm tool and I believe some places have done that. It sure would be nice to, for example, send flood pics to ecomm center instead of trying the email route and I believe if radios are wired to work fldigi they will work EASYPAL.

I was able to chat early on. As the morning went I lost connection with several members. KD2DO I believe was able to relay me on the 80 meter net. I like early nets myself. I start here in Western Mass @ 8:30 with the Western Mass Emergency Net on 80 meters 3.944 LSB then I go to the local repeaters for several nets. The 10 am paNBEMS net time gives me time to send off my net log as I am one of three net controls for the WMEN.

But I am open to whatever fits the needs of the paNBEMS group :)

bulletin on olivia 8/500 then follow with a more detailed bulletin using FLAMP
and FLDIGI, the mode of which will be announced on olivia prior to the FLAMP
transmission. This will give new digital ops and lurkers the ability to simply
copy the messages.
>>
>>To copy the FLAMP message, just download, install
and open the FLAMP program. FLAMP has to be running along with FLDIGI in order
to receive the message files. Make sure you are running the current standard
versions of both FLDIGI and FLAMP from http://w1hkj.com/download.html
>>
>>The
goal with the bulletins will be to provide a low-pressure way for ops new to
digital to start getting involved. My hope is that we can then get them to
take the next step by checking in and bringing traffic to the schedule and
then eventually building up our NCS volunteers from there.
>>
>>Following
the bulletins, any of our check ins (within or outside PA) are welcome to
stand in and pick up NCS operations.
>>
>>The 80m 9:30am ET paNBEMS Sunday
morning net will remain unchanged with us taking check ins by specific area
followed by the passing of traffic and bulletins.
>>
>>Starting in February,
we will start calling stations by PEMA Task Force areas on the 80m paNBEMS
net. I will publish the list of PEMA PA Task Force areas by County here on the
list and also transmit the list prior to the start of the Feb 80m paNBEMS
nets.
>>
>>Please help spread the word on paNBEMS and I hope to see you all
on the waterfall tomorrow.
>>

>>I'll be taking NCS duty for 80m at 9:30am
tomorrow morning and doing the 40m bulletins at 11am ET before I have to head
out for work.

Regardless of what time you change it to some one going to some church will be unable to attend the net. For example this year my church is 9-12 MST, next year it will be 11-2, year after that 12-3. Repeat. We have different areas that use my church for their meetings so we rotate. No one net time will be perfect for all.

Agreed.

Here's what I'm working with in trying to have the best time slots for paNBEMS.

- 8:00am ET is PEMA Statewide phone net (First Sunday)
- 8:30am ET is PEMA Central PA phone net (weekly)
- 9:00am ET is PEMA Western PA phone net (weekly)
- 9:00am ET is PEMA Eastern PA phone net (weekly)
- 11:15am ET is my hard stop for me to get out to work (12-6 shift)

So, 9:30am works as the 9:00am PEMA Western and Eastern Region nets usually wrap up between 9:20 and 9:25am ET. Without overlapping on the 8:00am, 8:30am or 9:00am ET PEMA nets, we'd have to start around 6:30am, and that darn sure isn't going to happen.

paNBEMS net schedules stay fixed at 9:30am ET on 3.583 USB and 11am ET on 7.0725. For those who can't make the skeds, you can monitor while you're out of the shack. Or, better yet, assign a liaison station from your local nets to come in and move info to and from the paNBEMS nets.

5468. FLAMP not receiving

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-01-29 18:19:23 UTC
From: Dennis Neese
Topic: 5461 Message: 5468

Hello paNBEMS

I have tried receiving with FLAMP and can not receive anything.

The normal FLDIGI receive window does show I am receiving. The FLAMP receive window shows nothing. The set seems correct. I have checked with the help files. I use a TS2000 with a Singnalink
most days on HF. Transmitting and receiving using FLDIGI is no problem. Even Easypal seems to work so I believe my set up including audio levels are OK.

On the set up tab in FLAMP all 3 check boxes are checked. My call sign is entered. Have info in the "info box"

Any Ideas?

Dennis,

You probably know this, but FLAMP has to be on and running to receive the FLAMP files.

Are you running the most current versions of FLDIGI and FLAMP?

What mode(s) are you testing with and how are you testing (computer to computer, FM simplex/repeater or HF)?

I'm on 7.0725 USB, in and out of the shack today until about 5pm. Maybe we can do some testing.

Dennis and all,

It seems that you have to wait ‘a long time’ before anything show up on the screen, maybe 1/2 way through or near the end of the first transmission. I thought several times I wasn’t receiving then all of a sudden it popped up, may a different scenario with you but that happens with me.

From: kf5fnp
Topic: 5471 Message: 5471

Hi,

I downloaded the latest version of FLDIGI 3.21.66 and tried to use it tonight. When I hit the TX button the radio would transmit for about 1/2 second then the waterfall would lock up about every 5th. time I transmitted. I'm using my regulator station setup which has worked in the past with no problems. I tried different modes and two different lap tops. I checked connections on the computer, signalink, and radio.
The .65 version worked great, I'm sure it is something I'm not doing correctly. Any suggestions?????????

Thanks for your time.

Dave
I reported into the Virginia Digital Net VDN on Monday evening. We tried some FLAMP. FLDIGI was running. Received Olivia just fine. Then NCS switched to one of the higher speed sound modems, I think 5Xpsk125 for the FLAMP messages.

Will try this week with a slower modem

FYI

I am asking all PIO's and newsletter editors to please add the text below. Please forward where appropriate. Thanks.

W8SGT is facilitating the Ohio HF Net every Tuesday at 6PM. The net is run from the State of Ohio Emergency Operations Center in Columbus on the Ohio ARES Admin frequency 3875 kHz LSB. At, or about 6:20PM, the net switches to the alternate frequency of 7240 kHz. All are welcome to check in. Anyone with questions or comments regarding the net should send an email to w8sgtohio@....

The Ohio ARES/OES Digital Emergency Net is held every Tuesday at 8PM. This net is held on 3585 kHz USB. All are welcome to check in. This net is looking for additional net control stations. Anyone interested in being a net control station is encouraged to contact the Net Manager. Anyone with questions or comments should send Net Manager Gary NJ8BB and email to nj8bb@ohden.org. Be sure to check out the new website http://www.ohden.org/ for details.

Starting tomorrow, Feb 3, 2013, the paNBEMS 80m net on 3.583 USB at 9:30am ET will call PA stations by PEMA Task Force areas. After calling PA stations by Task Force area, we will call for net liaison stations then go to bulletins and traffic followed by general check ins.

Sunday 40m 7.0725 USB schedule at 11am ET will start with olivia 8/500 bulletin followed by an FLAMP file transmission. Any volunteers are welcome to pick up NCS duties following the bulletin and FLAMP transmission.

Here are the PEMA Task Force areas by county:

Northwest PA Reg 2
Crawford
Erie
Forest
Venango
Warren

Northwest Central
Cameron
Clarion
Clearfield
Elk
Jefferson
McKean

Region 13
Allegheny
Armstrong
Beaver
Butler

A request for help here on the West Coast... Where do you transmit and receive traffic on 2 meter and 70 cm bands? Are you using SIMPLEX? Repeaters? certain parts of the band?

I'm involved with ARES in the Los Angeles area and trying to get this great tool off the ground, but encountering resistance:

1. Folks think digital does not belong on VHF or UHF. I don't read the bands plans that way, but there has been claims that we are breaking FCC rules...

2. There are also individuals that say REPEATERS can't be used to pass NBEMS messages. No rational about why (or they fall back on claim one above, and say no digital on UHF/VHF). I believe that our repeater owners would support the use, if they were sure that what we are doing is legitimate...

I'd really love to hear from the folks that are using these tools regularly. Where are you using them on UHF and VHF and if your using repeaters on a regular basis.

Hi David, there are a whole lot of people that know a whole lot more about it then I do, but here in Ohio County (Wheeling), WV, we do practice session over repeaters. The clubs we are involved in own the repeater so it is not a big deal. We also have simplex freq's for back-up if we need to.
Good luck!!!

David,

FCC regs 305 and 307 help answer you questions I believe. You are correct , digi can be used vhf and uhf and most digi modes work great over repeaters , just be sure the delay time to access doesn’t strip some code off the start and don’t time out the repeater. The PA guys have a lot of experience and the FCC does recognize that repeater owners have to the right to control their repeaters as you state. We have tried mt63 here on our local rpt and works great and we can do d-rats at the same time as voice on our dstar repeater.

I think you will find what you ask falls within the FCC regs.

In Fulton County NY, we are new to NBEMS and are currently training our ARES/RACES members in its use. We do our training and send messages on VHF/UHF on both repeaters and simplex frequencies. We have no issues with this. We just try to be courteous to other users. We also announce that we are going to send a digital message before we send it, and we also ID verbally, even though your call sign is in the digital message. The bottom line is to be courteous to other users and there shouldn't be any issues.

Whenever you try to do something unusual, particularly in an area with a large ham population, someone will accuse you of breaking the rules.
In this case, they are completely wrong, but that's not unusual, either. There are good reasons to avoid repeaters, however. First of all, counting on a repeater to be on the air after the next big earthquake or tsunami is not a good idea. If a lot of people monitor a repeater, using it for digital will cause them to all switch their radios off - so nobody will ever monitor that frequency. Of course, with too many repeaters, the same thing happens if you use it for voice communications!

I had a 2 meter net here covering SE Minnesota that started out on simplex, and we actually did pretty well in a radius of 40-50 miles. We moved to a local high level repeater, which made it easier for some folks, but the net really kind of died out. Now, there are some smaller local nets running on simplex, mostly.

If you are going to use repeaters, be sure you have permission from the owner and that none of the primary users object. In your case, it looks like you are only interested in supporting a portion of LA County? Simplex should work for most of what you do - but handhelds will be at a big disadvantage. Around here, we strongly recommend 50 watt mobile/portable radios for ARES work, because they can almost always cover a county on simplex with a decent antenna.

My strong advice would be to switch to simplex. You'll lose some folks, but at least you'll know that the rest of them can communicate no matter what happens.

Your ARRL LAX Section website lists a number of VHF traffic nets, which they are doing on the PAPA system. I suspect you'll get shot if you try digital there as hundreds of people monitor PAPA all the time. It also looks like ARES has the use of the DARN linked repeater network in your area. I would avoid that one, too. I don't see any simplex frequencies listed, so maybe you could suggest that to the SEC? As an EC, you should be empowered to designate your own. I'd pick a few VHF and UHF frequencies that aren't used for anything else.
Here in Minnesota, we have a set of statewide ARES frequencies that are published, and many counties have their own.

John,

Do this... I'm assuming you clicked "Save" in FLAMP and saved that macro file and that you're running Windows. If you did, go to FLAMP, File, Folders. Find the macro file then right click on that file then click on the "copy" option. Then go to FLDIGI, File, Macros and click "open". Right click in that folder and then click on "paste". Now you can highlight that file and click open and you will see the custom macro set appear on your FLDIGI view.

I'm getting ready to replace my old computer. Once I do, I'll be doing some new videos on procedures like the one described above.

A few comments:

NBEMS modes are no different than 1200 baud packet, in that they're basically modulated audio subcarriers.

I agree with the comments about using simplex where possible, but I also face terrain problems similar to various areas around LA (San Francisco Bay Area, which has a series of north-south ridgelines which extend up 1000 ASL or so (pushed up by the action of the San Andreas fault). My County (Contra Costa) is split by two such ridges, the second of which includes Mt. Diablo at 4000 feet.

We have practiced handling simplex traffic by putting people up on the ridges to relay. Because of the usability of of acoustical coupling on VHF we have demonstrated the feasibility of using a handheld and a voice recorder ap on a smartphone, and no other equipment, to copy traffic from one side of a ridge and transmit it to the other side.

We also have an agreement with the club that owns a group of repeaters on Mt. Diablo to use the linked 220/440 repeater system one night a week for training purposes. The 440 system is degraded because of the Pave Paws radar being line of sight, so it transmits about 50 mw, but the receiver is good, and a lot of dual band radios will receive on 220, so we do a cross band repeat so that the folks on the Bay side of the East Bay Hills ridge can copy. We don't count on that repeater set, which is committed to the health services in the event of an actual emergency.

As far as choosing simplex channels, for voice we are working with surrounding counties (San Francisco, Sonoma, Napa, Solano, Yolo, San Joaquin--it is a big problem!) to coordinate as best we can to avoid stepping on each other. We have the additional problem that the CERT folks in our county have adopted 2 meter VHF for their tactical voice use, so are using up the standard simplex channels. My county has 20 cities, each of which has its own CERT groups.

The Northern California band plan (see www.narcc.org) provides for what were once thought of as 1200 baud packet channels, and what little packet traffic there is is concentrated on just a few of those channels, so there isn't much problem about picking a simplex channel for NBEMS use that will bother no one else, and its ability to clear traffic much faster than voice allows the use of many fewer channels.

The issue of what emission types are permitted on what bands is covered in the regs (47 CFLR 97) section 97.305, a copy of which is available on arrl.org. Data, narrow or wideband, is explicitly permitted on 2 meters and above.

I am intensely jealous of folks who have terrain flat enough to cover 40-50 miles on VHF . . . right up until I drive up to the top of Mt. Diablo and can see the Sierra Nevada snow cap across 80-100 miles across the Central Valley one way, and the Farallon Islands, 25 miles off the San Francisco coast the other way!

John,

Do this... I'm assuming you clicked "Save" in FLAMP and saved that macro file and that you're running Windows. If you did, go to FLAMP, File, Folders. Find the macro file then right click on that file then click on the "copy" option. Then go to FLDIGI, File, Macros and click "open". Right click in that folder and then click on "paste". Now you can highlight that file and click open and you will see the custom macro set appear on your FLDIGI view.

I'm getting ready to replace my old computer. Once I do, I'll be doing some new videos on procedures like the one described above.

Topic: 5478 Message: 5486

Ok, John. We're all glad to help.

Keep in mind that we're digging into some advanced stuff here and it's important to remember that for basic operations, most folks get up and running with the ability to send and receive messages in no time at all by just using the default program settings.

When you get into the more advanced stuff you'll find the program offers a lot of flexibility once you start digging under the hood. An example is that I have about 5 different custom macro sets I've build for different types of operations. Some are for nets, I have one for the PA QSO contest and one for rag chew.

You can also set FLDIGI for different screen views for the macros. For instance, under Configure, UI, Macros, I have the 2 bar (Scheme 3) selected, which puts the main macro line above the waterfall with the secondary macro view below the waterfall. You can arrow over the lower bar and use your mouse wheel to move through the other 3 macro sets and if you don't have a mouse wheel you can click the number button to the right of the bottom macro line to toggle through the 2, 3 and 4 macro lines.

More info on FLDIGI macros at:
http://w1hkj.com/FldigiHelp-3.21/Macros.html

Please let us know how you make out with NBEMS as you move forward and let us know if you have any other questions.

5487. Net Control Questions

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-02-04 18:06:12 UTC
From: elancki
Topic: 5487 Message: 5487

I'd like to get a better understanding of the process of net control in an EmComm net. I haven't been able to find much on the Internet regarding EmComm net control, so I decided to post a few questions:

1. Do you use software to record net check-ins and check-outs? If so, what is your recommendation?
2. In an emergency situation, what are the criteria for Alternate Net Control Station (ANCS) selection? What are the prerequisites for being ANCS?
3. During an extended emergency, when net control must be passed between various NCS and ANCS operators, how are the transitions planned/scheduled/impemented?
4. How does the list of net participants, and their status, get shared between the NCS and the ANCS?
5. If a ham can hear some of the participants in the net, but can't hear the NCS or ANCS, how does the NCS differentiate them on the list of net participants, for the purposes of relays?
6. When a message or file is transmitted using FLAMP, how are relays handled, particularly for participants who can't hear the NCS or ANCS?

Thanks for your help,
Ed

Ed,

Many of your questions on NCS ops are covered in the file section of this group under, Procedures, NBEMS_Net_OPS_Guide_08_2012.pdf

FLAMP came along only recently but I would think that during an actual emcomm situation we'd primarily be using FLAMP to send larger files to only a few designated stations. In an actual emcomm situation, we'd most likely move folks off the main net frequency for relays, as directed by NCS.

We might also use FLAMP in the early stages of a potential emcomm event using a slower speed mode with multiple repeats and a very short message with basic info like net frequencies and very concise situational awareness reports. This use of FLAMP would assure that all stations monitoring on a call spot would have the best chance of receiving 100% with the multiple repeats on a slower, more robust mode.

paNBEMS is sending FLAMP bulletins on our 40m weekly schedule as a way to demonstrate this file transfer protocol, mainly with the high speed modes and we will work into more testing with shorter messages on slower modes this year.

I never exclusively use software for basic logging and would highly recommend the NCS keep a paper log in the event of a computer crash, which over the last 7 or 8 years has happened to me on a few occasions.

We don't really have concrete criteria for NCS and would encourage any available op to take NCS duties, even if they're not highly experienced. Just as in ICS/NIMS, they can always pass off command to a more experienced op once one comes on frequency.

If the hand off of a NCS duties should occur, the current NCS should pass the net info over to the incoming NCS and include any traffic being held as well as a summary of net ops at key locations.

Another possible duty/position in an actual emcomm event could be a scribe (maybe someone outside the affected area), assigned by NCS, to log all key information transactions during the event, which could be sent to the incoming NCS to bring them up to date on all the current and most relevant info to the point of the hand off.

We'll certainly be doing drills and exercises that will uncover weaknesses and strengths in the current procedures and give us some new goals and standards to work toward.

Now that we have a very effective way to send large amounts of information with NBEMS, I think our next big challenge will be data management, and that's going to be a fun and exciting problem to work with.

Dave,

We definitely need to get the permission of the repeater trustee(s) prior to transmitting MT63 or SSTV over a repeater. Here in the Sacramento Valley I asked about using the WD6AXM 146.085 located on the Sutter Buttes and it turns out the site owner stipulates voice only because the site is shared with commercial and government radio so they really don't want to do anything that may cause a problem at the site. My suggestion is try to utilize a less high level machine or less popular or maybe on the 220 or 440 band. I am planning to install an Argent Data simplex repeater on a 2 meter radio so members of our club and surrounding areas can use it to relay NBEMS and SSTV signals. It will utilize a 110 watt surplus land mobile radio turned down to 50w and have tone squelch. You don't necessarily need to have real-time repeating to get a digital signal through, and with a touch-tone pad you can have it repeat the last TX again in case someone didn't get copy. Also very handy for a user to listen to their own transmission if no other station is around to give a radio check....one of the reasons we struggle to develop interest in NBEMS is hams tend to stick with active frequencies and modes. They will set up an interface for the HF rig for instance and lock the VFO on 14.070 and ragchew on PSK-31 and never experiment with fast modes on VHF-FM. Perhaps a simplex repeater on an approved simplex frequency will help get a spot for folks to create activity.

5490. Trouble with flmsg popups

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-02-06 06:11:44 UTC
From: Klaus Berkner
Topic: 5490 Message: 5490

I used to get an flmsg message popup in IS213 format soon after I received a message in fldigi.

With fldigi 3.21.67 and flmsg 1.1.29 this no longer happens on either my PC with windows 7 or my Mac with OSX 10.8.2

On my PC:
Up pops (in NBEMS.files>wrap>recv) a list of files labeled "extract-20130206-060013". If I click on the item, it opens in IS213 format. Question: Why doesn't it open automatically?

On my Mac:
Up pops a folder "recv" with a list of files in the form "extract-20130206-060013.wrap". When I try to open it, I get a message "The document 'extract-3.20130206-060013.wrap' could not be opened. Fldigi cannot open files in the 'fldigi-3.21.67 Document' format." What do I need to do to open it, and why doesn't it open automatically?

Any help would be appreciated.

Klaus,

Check FLDIGI under Configure, Misc, NBEMS to see if you are pointing to the FLMSG.exe using the "Locate FLMSG" button and make sure the boxes are checked to open FLMSG and the message in your default browser on the same screen. Make sure you click "Save" before you close.

Hi Dave,

I had some more thoughts regarding your question:
Having a well-known "watering hole" frequency for NBEMS practice on V/UHF FM would stimulate activity and experimentation. Some kind of contest like passing a message by relays across the nation without the internet could get publicity for ham radio.

One factor to consider with repeaters is co-channel interference potential. Our club repeater shares a frequency pair with another repeater so we have to have our net at a different time than the other club.

Also I would stay away from running MT63 on any packet frequency. Packet is not compatible with other modes and the more activity there is on a packet channel, the more collisions and retries so the situation escalates to where packet doesn't get through well....to say nothing about an unexpected packet burst messing with the NBEMS traffic. Remember the FM capture effect....the strongest signal captures the RX.

Maybe encourage casual participation by using a simplex repeater bulletin in MT63 to announce club events etc. so all members and listeners can receive the bulletin with Fldigi and an audio cable hooked to their radio....emphasize unattended reception capability of the software!

I have been keeping track of logins during the nets using the logger built into FLDIGI.
There is a bit of a learning curve to it, but it isn't hard. It is pretty easy to double click on a callsign, then click on the globe icon to do a QRZ lookup which enters the operators name.
Then I highlight the QTH and do a Shift Click to enter that in the proper field. I add any comments in the comments field and the record is ready to store in the log.

It helps a lot to keep one long continuous log because when one double clicks on a callsign, the program looks up the most recent entry for that callsign, which in many cases, because he was in the net a week or two ago I have filled in other info such as city and state. Logging this person again copies that information to the end of the log with the current date and time.

It is easy to show the log, or at least a portion of it, to the left of and underneath the FLDIGI screen so checkins are easily visible. Entries in the log can be queried and updated easily. So you could keep track of a station's tactical assignment (west side shelter, or water station 2, etc.) in the comments section of the log entry.

Making a report in CSV format is easy, as would be passing it on to an alternate NCS.

With a little practice and some good Macros, one person could probably do this and run the net at the same time.

Sincerely, KD2DO

Major Winter Storm to Impact Northeast and New England Friday into Saturday

A major winter storm is expected to impact the Northeast and New England Friday into Saturday. As much as one to two feet of snow is forecast from the New York City metro area to Maine, with localized heavier amounts possible. This, in addition to wind gusts as high as 60-75 mph will create significant impacts to transportation and power. Coastal flooding is also possible from Boston northward.

5496. Re: Net Control Questions

Hi Paul,
Thanks for the suggestions. I'll give them a try during the next net.

KB3FXI has been asking for others to take a turn at being NCS for the pa-NBEMS net. It would be good for all participants to be able to handle the NCS or ANCS tasks. The same goes for handling relays. Even though I'm not in PA, and my station is not the best for a NCS, I thought it would be good practice to try and take a turn at it. Prior to getting involved with NBEMS, I hadn't participated in any nets. So I don't have any experience at handling the "workflow". There's more to it than just using macros to activate the net, especially when propagation is marginal and relays are required. It might be worthwhile to devote some net time to training of new NCS and relay operators.

FLDigi has an incredible number of features, many of which I am still learning. As you pointed out, the built in logger could be used for net control operations. One additional feature that might be useful for a NCS, would be the option of filling in the "County" as one of the QSO fields.

W1HKJ also has an application called "Net 6.0.04", which I've tinkered with a bit during a local VHF phone net. It streamlines the process of taking check-ins, and displays a concise list of the calls. But the "Net 6.0.04" records are stored in "xbase" format, which isn't compatible with the log files. What would be handy, would be a "Net" window in FLDigi that listed all of the check-ins. Its database would be the log file. When participants check into the net, their calls would be added to the "Net" window, and if necessary, appended to the log file. The "Net" window would help track those who check in and out, relay operators, and such. Hierarchical indentations could indicate which calls require relays, via which operators. It also might display information such as tactical calls, counties, states, etc. Clicking a call in the "Net" window would recall a specific call sign to the FLDigi QSO fields. Then the NCS operator could use the call and name fields in macros to direct a QSO to a specific net participant. Another possible feature would be a menu options to print the check-ins from the log as a table, or export the check-in list as a CSV file. That might help fulfill KBFXI's requirement to have a paper backup list, and would facilitate transferring the list to another NCS, ANCS or relay operator. I think some of the pieces already exist in FLDigi and Net 6.0.04, but the two apps don't cooperate at this point.

Becoming a proficient NCS operator is the product of experience. But a few software tools could make it easier for newbies like me to get up to speed, and could expand the pool of available NCS, ANCS and relay operators.

Thanks again & 73,
Ed

Dave,

I had the settings set to point to flmsg.exe,on my PC and it still didn't work; however, by using "restore defaults" and reconfiguring my settings I was able to get popups to work just fine on the PC.

The Mac is a different problem. Reset didn't help. Also none of my fllmsg applications have the ".exe" suffix. So far no popups pop up, although the messages can be found in the folder .nbems>wrap>recv.

Cathy, the flmsg versions seem to be the correct ones.

Paul,

NCS can be a handful and the rare computer crash or power glitch can really put a wrench in the works with NCS ops. I had a power glitch here early on in my NCS duties with paNBEMS many years ago and that was my first wake up call on relying on the computer for my logs as NCS.

Since then, I always keep a paper log. But, since you've been doing the off-site logging, I see great value in having an assistant NCS keeping the log. If, for instance, I was running the net and had some major failure at my station, you could pick it up or hand off the net info from your log to another back up NCS, or just take the net yourself.

You're assistance in keeping the log and passing that data back to NCS after the paNBEMS nets is very valuable.

I have also acted as a scribe for HF phone nets, typing up all the most important info garnered from monitoring the phone nets, then switch to an HF digi call spot on a specific schedule to transmit out the information by bulletin as a situational awareness message so that manned and unmanned monitoring stations can get updates.

Subject: [paNBEMS] Re: Net Control Questions

I have been keeping track of logins during the nets using the logger built into FLDIGI.
There is a bit of a learning curve to it, but it isn't hard. It is pretty easy to double click on a callsign, then click on the globe icon to do a QRZ lookup which enters the operators name.
Then I highlight the QTH and do a Shift Click to enter that in the proper field. I add any comments in the comments field and the record is ready to store in the log.

It helps a lot to keep one long continuous log because when one double clicks on a callsign, the program looks up the most recent entry for that callsign, which in many cases, because he was in the net a week or two ago I have filled in other info such as city and state. Logging this person again copies that information to the end of the log with the current date and time.

It is easy to show the log, or at least a portion of it, to the left of and underneath the FLDIGI screen so checkins are easily visible. Entries in the log can be queried and updated easily. So you could keep track of a station's

tactical assignment (west side shelter, or water station 2, etc.) in the comments section of the log entry.

Making a report in CSV format is easy, as would be passing it on to an alternate NCS.

With a little practice and some good Macros, one person could probably do this and run the net at the same time.

Sincerely,
KD2DO

I wonder if you've ever just done a clean sweep by deleting all your NBEMS programs and associated files. Maybe you haven't uninstalled your old versions and there's some sort of corrupted file or conflict going on.

I'm on the alpha team and have not seen any reports of problems similar to what you are reporting.

http://www.w1hkj.com

!!! IMPORTANT BUG FIX RELEASE FOR RTTY MODEM !!!

Version 3.21.68 - Maintenance / Bug fix release

RTTY bug fix
* Missing initialization for Cmovavg bit filter pointer

RTTY filters
* added Modified Lanzcos RTTY Rx filter
Hang on start
* Erroneously created / deleted new thread for instance when rig_cat not being used for rig control.

Analysis
* Added timeout value to extinguish status message

WF only ESC abort
* Capture Escape to prevent program shutdown when Escape pressed when --wo dialog has focus.
- Rx - escape ignored
- Tx - transmit aborted, return to Rx
- Tune - tune aborted, return to Rx

rigMEM
* removed rigMEM support code
- KC505 transceiver control no longer uses this converted to use xmlrpc control.

WF only null pointer fix
* in waterfall only mode, bypass text logging of rx stream

RTTY config tab
* Cosmetic corrections

RTTY stop bits
* remove forced return to 1.5 stop bits for Baudot

73, Dave, W1HKJ

5501. Winter Storm

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-02-09 23:40:07 UTC
From: Fred VE3FAL
Topic: 4352 Message: 5501

I hope everyone is coping ok after the storm has gone through, now the aftermath and shoveling. I hear some heavy rain is now falling in some parts after the snow.

I was on 80 meters last night digital modes but the RTTY forced me to shut down the radio.

Thunder Bay International Airport YQT is also experiencing delays due to problems in Chicago and Toronto after the snow.

I will be in Varadero next week on vacation and will be away from radio for the entire week except for when I visit my friend Arnie CO2KK at his home.

I hope you all do ok in the cleanup of this winter storm, we are in for about 15cms of snow tonight, but have not had much of a winter here, been very mild compared to winters that I remember.

Regards

Fred VE3FAL

Hi All,

After this mornings 40 meter net I tried to move the macro file to a folder so it would open. I put it in the marco folder in Fldigi..it would not open. Does anyone know where I can move this file so I can see it open up. Every place I have tried to move it Windows pops up with a box asking me what program to use to open it up.

Thanks, John W1JWN NBEMS newbie :)

This is W1JWN - John from Chester, Mass 01011

Topic: 5502 Message: 5503

Hello John,
On my computer (running Windows XP), the macro files go into the following folder:

C:\Documents and Settings\Ed\fldigi.files\macros

In my case, "Ed" is my sign on, so "Ed" appears in the path. On your computer, the path would need to be changed to substitute your sign on instead of "Ed".

Windows 7 or 8 would have a slightly different path, so you might have to search for the location of your "fldigi.files\macros" folder.

Once you have copied the paNBEMS.mdf to the fldigi.files\macros folder, you should be able to change macro file in FLDigi by clicking the menu for File->Macros->Open, then navigate to the fldigi.files\macros folder, select the paNBEMS.mdf file, and click the Open button.

73,
Ed

Hello all,

The SATERN Southern Territory digital net is activated for Severe WX net on 14.065 USB, 1000 Hz Center, 2xPSK250R FLAMP.

Any stations that can jump on for relay help would be greatly appreciated.

-Dave, KB3FXI

BTW, 2xPSK250R with FLAMP is playing very well even with light copy stations here in Pittsburgh.

Today was an interesting test on 20m digital.

Southern Territory SATERN net today had ad5xj (LA), aa6la? (CA), wb0kgn (MN), station ending in emb (MO - can't remember the full call) and w1hkj (AL).

We had pretty good success sending some FLAMP. I was quite surprised at how well 2xPSK125R worked on 20m.

FLAMP continues to prove itself as a great protocol. Testing on HF and VHF/UHF has been going very well and combined with the high speed modes we can now send much larger files than we could prior to the introduction of FLAMP and the high speed multi carrier PSKR modes.

5509. receive audio levels

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-02-15 23:27:50 UTC
From: wb0kgn@...
Topic: 5509 Message: 5509

I was trying to use one of the new high speed modes in FLdigi on two meters. I was not having good luck receiving. I had always figured that when the little diamond on the lower right hand corner of the main page was green, receive audio was correct.

Well...the diamond was green. I reduced the the receive audio some more... reception was perfect. It looks like a good procedure for adjusting the receive audio levels might be to start at minimal levels, with the diamond indicator black, and slowly increase audio until it just turns green.

The high speed modes require more careful settings than those settings that might just work well at lower speeds.

Dave in Minnesota

5510. Audio Harmonics

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-02-15 23:21:36 UTC
From: wb0kgn@...
Topic: 5510 Message: 5510

When I got a report of audio harmonics using Olivia, I could hardly believe it. I was running about ten watts into my amplifier, and I had almost no ALC readings.
The problem: I had dialed up high attenuation in FLdigi. To get enough audio drive, I had the sound card audio level set quite high. That caused the problem. Overdriving the sound card and it was flat topping...distortion...audio harmonics. When I reduced the attenuation and correspondingly reduced the audio out[ut from the sound card, my signal returned to nice...normal...only one of it on the waterfall.

My limited brain power has it boiled down to an unscientific theory that some high speed modes that have low pitch sounding tones , don't do well on FM repeaters. High speed modes with higher pitched sounding tones seem to do better.

I've found that 10xPSK125R works extremely well on FM repeaters and simplex centered at 1500 Hz. 12xPSK125R is best centered at 1750 Hz and anything wider than that starts to get spotty but is best centered at 2000 hz.

I've found a low audio level is best with MT63, maybe 50-70% of a good sounding speaking audio level and 10xPSK125R on FM seems to work better with a slightly higher level, about the same as a good sounding speaking level.

10xPSK125R has even worked well over some fairly poor simplex paths and 5xPSK125R is a bit more forgiving on some of the limited testing we've done over an RF linked repeater.

Disconnecting the USB cable has caused the Windows soundcard manager to drop
the audio level to 50%. Raise it back to 100% and you will be OK.

Ok Charles, I checked the volume settings and it was lower. Wow---- I cant believe changing a cable would drop the volume in windows....but adding a cat 5 cable and 10' USB cable gave me what I needed. I want to use the signal link mobile. My 857 is in the back of my Blazer. So I needed to add length to the setup so I can use my netbook up in the front seat. I am using it now sending tests and it is working :) :) :)

Thanks , John W1JWN

Disconnecting the USB cable has caused the Windows soundcard manager to drop
the audio level to 50%. Raise it back to 100% and you will be OK.

Hi Don,

I reset the Fldigi program and have gone thru all the setting... Not sure what happened. I will double check the volume in XP thanks

Did you turn up sound in speaker icon. I had a Signalink fail. I could receive but not transmit. I change cables. Same problem. Change Signalink and I could transmit.

Glad you got it too work. I was getting frustrated on my end. I could decode, the Signalink do it's PTT thing but radio not transmit. I checked my speaker audio. It was cranked. I switched out Signalink and my radio did it's magic.

What band are you on?

5520. Central PA connection

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-02-17 20:19:15 UTC
From: jim.alles
Topic: 5520 Message: 5520

hello all, new here KB3TBX (general).

I am getting ready to get the Penn State Amateur Radio Club (PSARC - K3CR) ready for more digital stuff.

I was wondering if anyone knew who was responsible for setting up the following e-mail list?
PA-ARES-RACES-L@...

And what will be the easiest NET to start with, from here?

We have a couple of Yaesu rigs, FT-847, and FT-1000MP Mark V, and I'll be working on the soundcard stuff. (I have experience with APRS).

Thanks,

Jim A.

Jim,

Welcome aboard.

Here's where you can get info on the email list you are asking about:

http://www.pema.state.pa.us/portal/server.pt/community/programs_and_services/4547/pa_auxiliary_communications_services_program/567377

You're certainly welcome to join us on the paNBEMS Sunday nets at 9:30am ET on 3.583 USB and at 11am ET on 7.0725 USB. And please let us know if you'd like to pitch in as an assistant NCS.

Another option is to start a Central PA NBEMS net and we can liaison info between the nets.

Let us know if you need any help it getting started.

Ok, that sounds like a bit of a motivating purpose!

This is likely to be a slow start for me here,

but I will certainly keep you posted.

Meanwhile, I will pass it on to the PSARC members.

Thanks,

You have an NWS contact who is NBEMS capable or wants to become NBEMS capable? We could use that here too as at the moment SKYWARN messages are collected over VHF voice on a local repeater. They are then forwarded (somehow) to the NWS. I think if phone and internet are down the SKYWARN messages will not make it to the NWS.

5527. Software squelch

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-02-19 23:16:11 UTC
From: Brian
Topic: 5527 Message: 5527

I have tried to set the software squelch on and let my system monitor the nets. Is there something that turns it OFF automatically, maybe mode changes cause by the RX ID? I am using the latest ver 3.21.68 but I have noticed this in earlier versions. When it turns the squelch off
I end up with more gibberish than actual recieved text. Is there something that I am over looking?

From: jim.alles
Topic: 5528 Message: 5528

Hello,

I have installed some software and I like the preliminary results.

I do not see having to push two TX buttons as more than a slight inconvenience, but I wanted to know if there is an interface between FLDIGI and Echolink?

What I am proposing should be trivial for FLDIGI to control PTT, but a little backwards for Echolink to accept such a signal.

I have been Googling a bit, and have not found anything. Any ideas?

Although I just want now it for least-effort training, (until we get a HF rig connected up here), it might also make sense to leverage the internet to get in close to an affected region?

I didn't know there was a squelch. Please tell me where to look in FLDIGI?
IMO there also needs to be a manual RCV ON/OFF control so that I can prevent the program from decoding and storing traffic that is not destined for my station. I can't figure out how to do that either. It seems the default is to receive everything and print gibberish in between messages?

Scott,

Bottom right hand corner of the FLDIGI screen you will see a "SQL" box you can check or uncheck and right next to it is the slider to adjust the squelch level. Keep in mind that this is not like traditional radio squelch. The software squelch is actually a confidence level of the software that it is decoding an intelligible signal.

The use of FLMSG and FLAMP for any messages and files eliminates the need to scroll through all the raw received text and random characters (diddle). And both FLMSG and FLAMP ensure you have 100% copy.

If I understand the question, at the lower right I have circled two components. The verticle bar is the level of squelch and the other button is to turn the use of squelch on or off. If using squelch it will be yellow or green and if turned off it will be gray.

Thanks Dave. I will look for that squelch.
Yes I see your point about FLMSG and FLAMP, but the fact remains that in a busy net not all traffic need go nor should go to all stations. In a drill traffic will be directed. But with FLDIGI, everybody ends up with a copy of everything and has to do file management on things that may not pertain to them. That's a minor weakness IMO, but maybe the designers see it just the other way and are more concerned with accuracy and redundancy than inconvenience? I think in terms of traffic nets. In NTS the NCS directs traffic distribution and QNI stations only need to copy and handle what is going to their geographic area. The rest of the time they are just listening, but they do not have to copy every radiogram.

I think I was able to copy them. I fooled around with the user interface in configuration. I then copied the mdf files and they came up below. I hope I can modify them to help me with a net I want to start soon. This is a good day for me....

I was able to check into the NY-NBEMS net and then the Satern Digital net too.......

had some interference from RTTY but they were able to ask the ham to move up some...

Now I need to have the log work so I can send it out like it is done here....

Thanks again for all the help with FLDIGI....

FLDIGI downloaded and installed fine on my Windows 8 machine. My guess is that he is running Windows 8 RT. Windows 8 RT does not let you download or install executable files.

5540. Live Video Training

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-03-05 23:41:10 UTC
From: David Kleber
Topic: 5540 Message: 5540

Hello all,

First, let me thank wb0kgn, Dave in MN, for taking the time with me today to test Google+ Hangout. Dave and I met earlier today on 40m then switch up to 20m and from there we went to Google+.

Google+ "Hangout" is a free service that lets up to about 10 attendees into a video chat room. The person initiating the chat, or hangout, has the ability to share their desktop screen. Dave and I tested this very successfully today and we both agree that this will be a powerful tool for training.

In the Google+ Hangout, the presenter can share their screen, so those in the video chat can see the NBEMS screens, in real time, where we can walk new users through setup and operations. We can even run the screen share while on HF to see exactly how to operate FLDIGI on while on the air.

If anyone interested in testing Google+, go to https://plus.google.com/ and follow the directions to set up a new account. You can then add me (David Kleber - kb3fxi73@...m) to your contacts in Google+. Feel free to drop me an email at kb3fxi@yahoo.com and we can set up a sked to test the video/screen share service.

I have used hangouts to attend parties remotely. Former colleagues got together to eat, drink and gossip and could participate.

I am 100% in favor of using the internet to facilitate training. My HF antenna is down at the moment so I'm not on the air right now. I will add you to my ham circle on G+.

Thanks for this initiative

5543. Google + tonight at 8pm ET

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-03-12 22:53:06 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5540 Message: 5543

A follow up to my last message to the group on Google Plus.

I have had several successful sessions now on the Google+ Hangout (video conference) service.

I'll be opening up a Google+ hangout named paNBEMS tonight at 8pm ET for anyone who wants to jump on and give it a shot. I've not yet had the opportunity to have more than one other person in the video conference so I'm looking forward to hopefully having a few folks jump on with us tonight.

5549. paNBEMS video conference, 3/12/13

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-03-13 14:56:05 UTC
From: David Kleber
Topic: 5549 Message: 5549

Hello all,

We had a good test session on the paNBEMS Google+ Hangout (video conference) last night with the following participants:

KB3FXI (PA-ACS), WA6TVD (NV), WA3YOA (PA), W3TMB (PA-ACS/ARMY MARS), KC5GOI (TX-ARMY MARS), KB3BAA (PA), WB0KGN (MN)

A bit of the discussion focused on MARS ops with US MIL-STD-188-110A. This mode has a similar protocol to FLAMP but surpasses our Amateur radio frequency allocation throughput limits. We discussed the possibility of trying to arrange an interoperability exercise using digital modes and cross band operations to move data to and from MARS and Amateur frequencies.

There was also a good bit of discussion on FLAMP, FLMSG and the various modes we use in NBEMS and we shared our experiences with the different modes under different conditions and circumstances. The question came up on acoustic coupling and the high speed multi-carrier modes and I was able to do a live demonstration, using the screen share feature, so everyone could see FLAMP reception of my signal back from a simplex repeater in Ohio using the 10xPSK125R mode from my station and acoustically coupling. Guy in Texas (KC5GOI) said that the new high speed multi-carrier modes are outperforming 1200 baud packet in his testing on local repeaters and simplex.

This first real test of Google+ was a good success and all participants agreed that the video conferencing should add great value to NBEMS training.

Thanks to all who joined the conference last night. We will be making announcements here on the email lists when we schedule future conferences and we're considering possibly setting a monthly schedule.

5550. Text Errors

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-03-13 20:19:52 UTC
From: frankrocap
Topic: 5550 Message: 5550

I receive consistent reports of "print errors" when using my Win 7
computer but no problems with the old XP system.

The station consists of Yaesu FT450 Signalink USB and Win 7.
The Win 7 has: 2.4GHZ Intel i3 processor and 6G ram. The computer
has usb codec set as default and Fldigi sound settings are
44100 sample rate and the usb codec for capture and playback.
The sound card is calibrated using WWV.
I also have a TS590 with it's own built in sound card. I have the
same result with the 590 and the Win 7 computer but not when using
the XP computer.
I've been round n round looking at sound card settings & calibration.
I tried CheckSR settings with no difference and returned
to the WWV settings. Any ideas on a solution would be much
appreciated.

Dave, thanks for your reply. I have also been testing by
just using audio coupling between 2 computers and getting the
text errors. I see the most errors on Olivia 8/500.

The sound card level is at approx 50%. Then I use a combination of
the SignalinkUSB TX control/ Fldigi TX level attenuator controls.

On the computer sound card selection should it be the Signal USB codec or the computers sound card?? I always thought it was the USB Codec but just read the Fldigi beginners guide stating the following:

1. Beginners' Questions Answered

1.1. What is Fldigi?
Fldigi is a computer program intended for Amateur Radio Digital Modes operation using a PC (Personal Computer). Fldigi operates (as does most similar software) in conjunction with a conventional HF SSB radio transceiver, and((uses the PC sound card as the main means of input from the radio, and output to the radio.)) These are audio-frequency signals.

Of course I set the Fligi sound card selection to the Signalink
USB codec.

Thanks

I would start with the attenuation at zero, and the little black diamond in the lower right hand corner, the one that tells you about receive audio levels, black. I would increase the audio from the sound card/codec until the diamond just turns green. I have found on my equipment, that having the diamond green is not good enough for some modes...it can be green and there can still be too much audio.

In theory, higher sound card sampling rates should be better than slower ones, but I have not actually played with that variable. While I have my sound card sampling rate at 96,000, I use the error rate corection factor generated by CheckSR at a lower sampling rate (because CHeckSR only goes so high.). I suppose one could take the correction factor for 48000 samples per second and double it for 96000.

If I remember the instructions in the SLUSB manual, the computer audio out should be at max (100%) and the TX knob on the front of the SLUSB at mid-point. At least that was the setting I used with my radio before a freak static burst caused some unknown damage.

Yes, the USB SignaLink needs to have the "speaker" audio set to 100% so that the SignaLink can trigger the PTT. Adjust the TX knob to set the radio's ALC.

The idea should allow the creation of a master data base of who is likely to check in, and then allow the NCS to just enter in their call sign, and QTH and name should automatically pop up on NCS' screen. The challenge then would be to distinguish those on the master list that have actually checked in to the live net. This may be more work than I thought. However, if you want to pop your callsign and name in to the database , I will use it to experiment with.

Here's the macro the Dallas NBEMS net has been using for FM check-ins:
Not sure how it would work over HF.

<GOHOME><LOCK:on><TXRSID:off><TX>
<LD> <LT>,<MYCALL>,<MYNAME>,<MYQTH>,<MYLOC>,<VER><RX>

It transmits a one line report in the receive window like this
2013-03-14 2006,KD5OUG,Doug,Richardson, TX,EM12ox,Fldigi 3.21.68

With <TXRSID> Off, the reports neatly stack up in the receive window
for easy copying as a block of text which can then pasted into a CSV
form in Flmsg. This is saved for each net as a C2S file. The data is
also appended to a master C2S file.

The CSV form into which the reports are accumulated has these headers:
Date-Time,Callsign,Name,City,State,Grid Square,Version

The one gotcha is that the <MYLOC> must contain City and State separated
be a comma, i.e., "Richardson, TX". If you need County, then it could
be added to that field separated by a comma.

Take digital check-ins first then those with voice only. Voice only's
can be quickly typed into the CSV.

Thanks for the bandwidth. Hi, hi

The 20 meter sub-vets net (which I checked into once) uses Netlogger. It might be exactly what you are looking for. On the ther hand, I really don't know too much about it. It let me know who was checked into the net, and allowed for side comments...chatter...while the net was in session.

More on the idea.. I am trying to keep the concept simple, no actual software needed by users. Simply, those with Internet access could go to a webpage during the net and see who is checked in , who lists traffic, etc. I am not planning on people checking in to a net via the Internet. I'm still not convinced my idea is a good one..yet. It would have to be really easy for an NCS to use at same time as a net is occurring, not close to that yet.

Here is the view of the idea at this stage.

https://docs.google.com/spreadsheet/pub?key=0AspDrsBqAQCLdE9mSXZkcFNpOERtMi0xUXhiMDVYV1E&output=html

I started the idea during todays net but the concept is intended for other nets, not particulalry the paNBEMS net. If you have better skills at this idea than I do, please add them. Thanks.

You have a good idea going here.

One thing we have started doing on the dalNBEMS (Dallas) net is to check in via macro. NCS calls for voice only check-ins and then digital check-ins. To check in digitally the station gives their call sign phonetically and says "digital". The macro is then clicked in fldigi and the check-in info is sent. This is a way we have found that makes checking in easier on the NCS. Here is our macro. Hope you find some kind of use for it.

> In theory, higher sound card sampling rates should be better than slower ones, but I have not actually played with that variable. While I have my sound card sampling rate at 96,000, I use the error rate corection factor generated by CheckSR at a lower sampling rate (because CHeckSR only goes so high.). I suppose one could take the correction factor for 48000 samples per second and double it for 96000.

Jim, I also remember the 100% recommendation. I run as close to that as I can and then use the Signalink TX and Fldigi attenuator to attain the drive level to avoid ALC indication.

Dave, the problem I have is transmitting "errors".
with my Windows 7 computer. If you were to copy my transmissions
you would see random symbols and characters mixed in the print. I can't send an FLMSG
without errors. I have no problem with errors when using my XP computer.
I use WWV for sound card calibration as recommended by W1HKJ.
I just uninstalled Fldigi and the fldigi files and re installed
with the TX errors still present.

25 mi W of Philadelphia
iK$E PA FM29dx

Call sign, Location (no. of messages & destination call signL
+aMet or area
Pse pause to give priority to chec iA()w/traffic.

Three samples of what I'm transmitting.
I have two HF stations.

Stn A 10w into a dummy load,no alc indication
Stn B Receiving station, receive indicator-green. Waterfall shows
yellow with no red at all, signal strength s5.

Sound card volume settings at 100% and no ALC indication.

If I reverse and send with stn B to A I get the same result.

I've tried acoustic coupling with even worse results.

Could this be a computer issue as opposed to the fldigi software??
If so, what might it be??
The computers are Win 7 and both functioned normally at one point.

Frank,

Three questions come to mind here:
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
1. Are the Windows sound effects finding their way to the TX audio
channel?

2. Is the TX audio output level in the PC so low that the SNR level is
very low, making noise more prominent?

3. Is the PC suffering from DPC glitches?
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Any of these issues could lead to the effects you describe.

Frank

It isn't usually a "good idea" to run any analog setting at 100%,
because you then have no leeway for fine adjustment.

You may be flat--topping the audio with the level at 100%. I would
reduce it to, say 50%, then increase the audio input gain in the TX to
compensate.

Here's where you can get a free program to test your computer sound card latency:
http://www.thesycon.com/deu/latency_check.shtml

I have not used this yet but plan on giving it a try tomorrow.

Here's an article on sound card latency where I found the link to the checker:
http://blog.jdslabs.com/?tag=audio-glitches

Frank,

Check to make sure you have no extra audio features enabled such as:
surround sound, bass response, any other types of tonal adjustments,
stereo enhancements, etc.

Since it did work at some point, it certainly sounds like an audio driver
update. You may want to look at the driver version and check mfg website
for related versions, you might be able to back down a version to check.

1
When I right click the speaker icon on the task bar and select
"sounds" I have "no sounds" selected.
Is there something else I can do to insure that windows sound effects are not finding there
way to the TX audio??

2
The TX output is at or near 100% following the Tigertronics Windows
7 setup instructions. I open the volume mixer and select USB codec
and make sure the volume is near 100% and the wave is 50%.
3
I don't know what DPC glitches are. Could you explain how to tell
if I have DPC glitches.

The ideas mention all require the individual stations to do something. I'm trying to simplfy things where NCS does not have to do a lot of work and stations checking in don;t have to do anything.

What I have so far is a spreadsheet . The spreadsheet would be used a a sheet for each net, when loaded by NCS it would contain the names and QTH of stations that usually check in. It would default to zero stations checking in, NCS would simply type a Y in the spreadsheet column for stations checking in. They would add traffic if that was listed. Any checked in would automatically have their callsign in a special color. Anyone with traffic would have that listed in a special color. During the net, NCS would periodically click on the "publish" button and the NCS log would be immediately available on the Internet for other stations to see, live.

A digital net, usually has frequent periods of time last 20 seconds or my where the NCS is in receive mode, so noting net events on the log would not distract t any more than writing a paper log. . A macro could be invoked to automatically create a net report in CSV format.

Of course, some may ask "why" ? Good question. Just seems NCS logging should be simple and not involve use of software that has to be installed. Netlogger seems unsupported these days and overly complex. Net , from the FL series, is good but I don't see a way to quickly post this to the net for check-ins to follow live.

I need to work some more on it , will use it in a net or two over the next few days.

Dave

To be precise, the DPC checker measures latency in the operating system,
not in the sound card. That said, the checker is a very effective tool
for helping to track down glitches in streamed audio or video. It's
unfortunate that there isn't a working Windows 8 version yet.

From: Skip K3CC
Topic: 5575 Message: 5575

Frank are you using a TS 590 ??
I have had a friend that has one and we had trouble with Olivia while using a signalink USB

He had the similar problems with Olivia but CW was fine

It seems that using the internal soundcard was better. You may want to check the digital menu of the radio I think it around the 60's (menu number)
You may have a conflict with the internal soundcard and the usb device

Skip,

I have a TS590 but this is occuring with my FT450D. It isn't
anything to do with the FT450D but with the Win7 computer.
My XP works fine. Check the post by Dave KB3FXI and also Ian
G3NRW on the DCP checker which my Win 7 fails badly and the
XP looks good

Thank you for the response.

I have been keeping track of checkins to the net for some months now. It took a while to build up a good database of most of the regulars (2 or 3 weeks) but now I have a good list of PaNBEMS and NyNBEMS and many of the MIDTN operators. The database logging program is embedded with FLDIGI. All it takes is a little time with the manual and a few weeks practice. The fact that it is built in is a great advantage. Learning all the shortcuts makes it a breeze. Contact me if you need some help using it. It is really easy.
For a newcomer to the net: double click on a call and it is entered; click on the globe and it looks up the call in QRZ and fills in the name; shift click on something highlighted and it puts that in the QTH field; add any comments in the notes field; click on the book and it is entered in the log.
For someone who has checked in before it is easier: double click on the call; the most previous entry of that person is looked up and all the personal information is copied to the ready fields; click on the book and all the information with current date, time, frequency etc. is entered into the log.
Last week I served as NCS for the NY_NBEMS net and was able to log as well as run the net. Using FLLOG within FLDIGI only adds a minimal amount of operator time. It is really no more complicated than, say learning how to write your own macros. At the end of the net, it takes about a minute to extract the current day's log as a CSV file, and prepare it for transmission via FLAMP.

Sent: 3/21/2013 12:54:19 P.M. Eastern Daylight Time
Subj: Using NBEMS while operating with IMT

Adams and York County Pennsylvania AUXCOMM (ARES/RACES) operators were invited to demonstrate NBEMS to the National Capital Region (NCR) Incident Management Team (IMT). Attached is a review of our day participating in the IMT's exercise.

Our primary purpose was to show that we can send & receive complex ICS forms such as the ICS-259-x.

Because of the number and complexity of some of the ICS Forms, it seems impossible to add all required forms to FLMSG or to write stand alone programs to send/receive these forms. Not only are there a large number of these forms, over twenty, but there are different layouts and added info on some of these forms used in by different agencies through out the states and national agencies.

Several of us have been testing the use of flatbed scanners to copy these forms and sending them via FLDIGI/FLAMP using the new high speed modes i.e. 12XPSK125R and 16XPSK125R. During testing we have successfully sent/receive 300KB (compressed) files over a range of 30 miles on 2 meter simplex. We were able to demo this to the IMT.

The attached document has five (5) pages:
Page 1 is the IMT's plan for AUXCOMM in their exercise
Page 2 is the time line of our activity
Page 3 contains Notes about our activity
Page 4 contains a script that we developed to use before sending traffic
Page 5 contains some pictures of our equipment setup and some of the forms we sent/received.

We believe that in order for AUXCOMM to be successful in integrating with federal & state agencies we need to show that we can handle their forms and understand their procedures. NBEMS now gives us that capability. NBEMS has come a long way in the past five years. We are confident that the

continued development of NBEMS will give us even more capabilities.

By-the-way, the Fed's like using the term AUXCOMM instead of 'AMATEUR'. Working with IMT's is a big step and to be accepted you really need to have taken the ICS-100/200/700/800 courses and ICS-300 is important. Everyone on the IMT is a paid professional and Ham Radio (AUXCOMM) operators are the ONLY unpaid volunteers now being considered to be integrated with their teams (learn more about the COML)..

My thanks to Dick WA3USG who has been instrumental in developing our use of scanner technology.

5587. Follow Up on Text Print Error problem

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-03-27 10:40:14 UTC
From: frankrocap
Topic: 5587 Message: 5587

A brief summary on the problem I had with print errors and the fix for my situation. I use Win 7, Signalink and Yaesu FT450D for digital.

I used a neat tool called the DPC checker. (latency checker). Dave KB3FXI first posted a link and then I got great help from Ian G3NRW.

The DPC checker showed many high latency periods occurring every few seconds on both of my Win 7 computers that were the cause of the print errors. Whenever I listened to audio unrelated to digital comms I would hear clicks and pops that I no longer hear.

After disabling common causes with no improvement I tried my security software. Malwarebytes anti-malware program was the major cause of the many high latency periods I encountered. With the paid version it is always running in the background. I also disabled the wireless device which is another cause of problems. Here is the link with info and download of the very small DPC checker. Credit goes to Dave and Ian for his direct e-mail help and some other helpful tool links.

5590. Sound level setting for FLDIGI

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-03-30 12:54:37 UTC
From: Dennis Neese
Topic: 5587 Message: 5590

Hello To The Group

I use FLDIGI on a Window7 OS with a Signalink.

In the control panel the settings for receive and transmit are around 40%.
Within the last month the computer system went through a automatic windows
update and install.

Before this update the control panel settings never changed.
Now I must check the control panel setting before each use of FLDIGI
because they change back to 100%. The settings within the FLDIGI program never change,
only the settings within the windows control panel.

Any ideas on how to prevent the system from changing the control panel settings.

This was my first time to setup and receive the VOA broadcast. I had pretty good luck with VOA today. I am going to have to run WWV mode and get the correction factors on my linux install. Both images has very noticeable slant to them but they were prefect beyond that. The html send in the Flmsg form was awesome.

I was surprised to learn that the VOA digi broadcasts were being viewed as possibly serving a useful purpose. FLdigi worked better on the slowest modes than DM780. (and of course better than DM780non the modes DM780 doesn't have).

This was my first time to setup and receive the VOA broadcast. I had pretty good luck with VOA today. I am going to have to run WWV mode and get the correction factors on my linux install. Both images has very noticeable slant to them but they were prefect beyond that. The html send in the Flmsg form was awesome.

From WB3ILX

Download a program called. Quick mix. It will allow you to save the Windows mixer settings in a file that you can reload before each session of FLdigi.

If you are using the Signalink USB the 100% settings should be fine since the actual audio levels are controlled by the knobs on the interface. In fact you need TX audio set at over 80% in software mixer to get the PTT to activate.

If you have the SL-1 and generate audio with computer sound card then you will have to deal with this issue. There is a program to save mixer settings available. Maybe one of the other group members can post a link to that.

5597. FLDIGI Crash

Yahoo group: paNBEMS (2012 — 2018)

From: Jim Rayburn
Topic: 5597 Message: 5597

For a helpful hint to anyone that may have had a similar problem. Issue is FLDIGI crashes immediately.

Recently another amateur contacted me. His FLDIGI was crashing when started and prior to the window being displayed. He had already gone through and uninstalled all FLDIGI and cleaned out his registry. Reinstalled the latest or a version or two prior and issue persisted. We went through the same steps with my help (using http://join.me to verify steps were completed). As he stated the issue persisted. I thought I was lost at this point but realized that regardless of the version being run it occurred on all versions. We opened the configuration files. On Windows 7 this is located at

C:\Users\[Your Username]\fldigi.files\

BE CAREFUL. This folder contains important files like macros and the config file for the radio you are using!!!

Rename the folder to something else and restart FLDIGI. In my friend's case the application was not crashing and he was able to use it again.

Copy the following folders to C:\Users\[Your Username]\fldigi.files\

C:\Users\[Your Username]\[renamed fldigi.files]\macros\
C:\Users\[Your Username]\[renamed fldigi.files]\rigs\

There may be other files as for me I would copy C:\Users\[Your Username]\[renamed fldigi.files]\IC-7410.xml

To copy the needed files is why you don't want to delete the original folder.

I have had good experience with installation of Fldigi and related files on a flash drive which worked fine. I don't have to worry about different installation details on different computers, or actions by Windows. This makes it ideal for quick and reliable exercise or emergency ops support. If you use this method with Windows, just remember to create a file called NBEMS.DIR in the fldigi.files directory to tell the program to do its work on the flash drive and not in the default Windows locations.

I have changed some computers around here. I have one computer running windows 7 and is dedicated to Digital
use. It has 10 serial ports and 10 USB ports. Memory is 2 gig I core2
I run 3 radios for digi with Tigertronics USB interface
Yesterday I added DX Lab logging software for contesting.
Since then my Tigertronics USB interface goes into transmit mode while in the RX mode.
I have to shutdown the computer to get the fault removed and restart

Has anyone else had this problem ??

This just happened with the addition of DX Lab which includes Winwabbler

Hey Skip

When that happens, do what I do: 1)run FLDIGI on a flash drive;
2)remove the offending program and try again; 3) temporarily remove
the "good" program, install the "offending" program, see if it works.
You may have conflicts with shared .dll files.

5603. Free DV?

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-04-02 17:46:08 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5603 Message: 5603

Hello all,

I wonder if anyone has tried Free DV, digital voice yet?

I got the program all configured and it looks like it's working but haven't had the opportunity to copy anything yet. I put out a few calls on 14.236 USB today but nothing was heard here.

It sure would be cool if they every changed the rules to let us run Free DV on the digital allocations. It might work pretty well on a solid NVIS path on 40 or 80m.

One place we could do some digi voice play with Free DV would be 60m.

The latest version of FreeDV (v 0.96 beta) works very well on the HF
bands. The place to look for FreeDV QSOs is:

http://qso.k7ve.org

and also:

http://www.obriensweb.com/sked/index.php?board=digitalradio

Thanks, Ian.

That beta version is the one I'm running. I just downloaded it a few days ago.

I'm looking forward to coming across a signal to copy... none so far.

It's a shame, and somewhat contradictory, that we have to run a digital mode for voice on the phone segments of the bands here in the US but can't run it on the digital band allocations.

But we do at least have the ability to run digital voice, phone and digital text modes on 60m.

I'm thinking that 60m might be a great place for us in the US to run digi voice and NBEMS on the same spot. I just wish we had more than 5 channels to work this kind of operations. The only other HF band we could do this on (I think) would be 160m and I don't have the real estate to put up a very long wire to work that band.

It just seems kind of silly that we can run digi voice and digital images on the phone portions of our band allocations but we can't run a relatively narrow digital voice mode on our digital allocations.

Okay, Dave... yes it sure does work!

To all on the list, WB0KGN and I just had a nice chat on 14.236 with Free DV and it worked very well. The audio is a little robotic but very clear. Static crashes tend to knock out a bit of the audio and give it a bad digitized sound.

We were on a very solid path and I would suspect that's just what Free DV needs. I don't suppose the mode will play very well on a weak or very noisy path.

I'd like to give the Free DV voice mode a shot on a QRN free evening sometime on 60m where we could go between digital voice and NBEMS and regular phone.

The great thing about amateur radio is there's always something new to learn.

Thanks, Dave (WB0KGN) for all your help in testing many different modes. We've had a lot of fun and learned a lot together.

I have been running this for a few weeks. We have used it on 2 meter simplex, through several 2 meter repeaters, and have made several contacts on 20 meters on 14.236 MHz. On SSB, you need S5 to S7 signal levels with a good S/N for it to decode but once it does, the audio is quite good. I believe that the developers are working on improving the codec to gain improved performance on lower S/N ratios. Bandwidth is only 1.1 KHz on SSB.

Very impressive and fun!

The York - Harrisburg - EPA area

"The Keystone VHF Club Digital Net"
Tuesdays starting at 8 PM and running until 9 PM
NCS: Richard Goodman, WA3USG or Jack Dellinger, KC3JD
On the Keystone VHF Clubs York 146.97 repeater W3HZU (Tone: 123 Hz)
Checkin mode: Voice or MT63-2K
Primarily an EmComm message passing practice net using FLDIGI, FLMSG, and FLAMP but sometimes we run SSTV and digital voice sessions for fun. Everyone is welcome to join in.

"The Keystone Digital Familiarization Net"
Wednesdays starting at 8 PM and running until 9 PM.
NCS: Craig Telesha, KB3ZJF or Lee Lindsay, WB3HNA
On the Keystone VHF Clubs York 146.97 repeater W3HZU (Tone: 123 Hz)
Checkin Mode: Voice or MT63-2K
Primarily a familiarization net where newcomers can become proficient at connecting their hardware (Computer, interface, radio) and learn the basics of FLDIGI, FLMSG, and FLLAMP. Enables them to become proficient enough to join other nets where participants are more advanced. Everyone is welcome to join in.

Lebanon Valley Digital Roundup Net
Fridays starting at 8 PM and running until we decide to finish
NCS: Bob Sanborn, AB3GF
On the W3XP Ephrata PA repeater on 146.610 (Tone: 131.8)
Various digial modes decided upon by the net participants that night.
This net is a lot of fun and everyone is welcome to join in.

Thanks, Larry, and great job on the INARES net last night.

We hope those PPT's will help entice newer hams to at least get the NBEMS software to set up and monitor the nets. I'll also be producing some new instructional youtube videos and some scheduled Google+ video conference chats.

Let us know if you have any success bringing in some new folks.

5614. Lubuntu 12.10, Signalink USB, FLDigi, Icom IC-730

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-04-04 17:15:17 UTC
From: PittHappens
Topic: 5614 Message: 5614

Hi Guys,

I'm new to the group, but I was told about the group by a friend of mine KF5FNP about your group, that might be able to help me with a situation that I'm having.

Let me first say this, with my Windows 7 laptop, I have absolutely NO problems, so to me, it limits it to OS or Software, not hardware anywhere. I have a Dell Mini 10 that I installed Lubuntu 12.10 onto...(I chose LXDE because of it's lightweight nature as the netbook only has 1GB of ram.) I can receive all day long PSK31 on FLDigi, but the second that I try to transmit anything, it keys up my radio (connected through acc port)but only for a split second and then stops transmitting. After this FLDigi freezes and is unusable until I end the process and then re-open it. This is the symptom in EACH and EVERY time that I try to TX. I've tried using the Macro's, I've tried manually typing, it happens every time... any help would be greatly appreciated.

Hi

If the Netbook has a USB port, try running FLDIGI from a flashdrive.

I'm actually not sure how to use macros that i download from the net from other ARES groups. I know where they go. But how do you activate them?

As to FLDIGI and windows 7 i too used it on win 7 and win 8 no issues.

NATIONAL WEATHER SERVICE LUBBOCK TX
815 AM CDT WED APR 10 2013 [abr]

THIS HAZARDOUS WEATHER OUTLOOK IS FOR THE EXTREME SOUTHERN TEXAS
PANHANDLE...SOUTH PLAINS AND ROLLING PLAINS.

WINTER WEATHER
ICY ROADS WILL CONTINUE ACROSS MUCH OF THE CENTRAL AND EASTERN
SOUTH PLAINS THIS MORNING DUE TO LIGHT ACCUMULATIONS OF SNOW AND SLEET.

NATIONAL WEATHER SERVICE LITTLE ROCK AR
826 AM CDT WED APR 10 2013 [abr]

THIS HAZARDOUS WEATHER OUTLOOK IS FOR A LARGE PART OF ARKANSAS.
BREEZY SOUTHERLY WINDS WILL BE SEEN ACROSS PORTIONS OF ARKANSAS
ONCE AGAIN TODAY...WITH WINDS OF 15 TO 25 MPH EXPECTED AHEAD OF A
COLD FRONT TO THE WEST. SOME GUSTS OVER 30 MPH WILL ALSO BE
POSSIBLE.

SHOWERS AND THUNDERSTORMS WILL BECOME LIKELY LATE
THIS AFTERNOON INTO THE EVENING HOURS AS THE FRONT INTERACTS WITH
WARM AND VERY MOIST AIR ALREADY IN PLACE. SOME STRONG TO SEVERE
THUNDERSTORMS WILL BE POSSIBLE

NATIONAL WEATHER SERVICE SHREVEPORT LA
548 AM CDT WED APR 10 2013 [abr]

THIS HAZARDOUS WEATHER OUTLOOK IS FOR PORTIONS OF SOUTH CENTRAL
ARKANSAS...SOUTHWEST ARKANSAS...NORTH CENTRAL LOUISIANA...
NORTHWEST LOUISIANA...SOUTHEAST OKLAHOMA...EAST TEXAS AND
NORTHEAST TEXAS.

A LINE OF SHOWERS AND THUNDERSTORMS...WILL BEGIN TO DEVELOP ALONG
A STRONG...BUT SLOW MOVING COLD FRONT...THESE STORMS WILL BEGIN TO AFFECT SOUTHEAST
OKLAHOMA...AND WESTERN
PORTIONS OF NORTHEAST TEXAS BY MID MORNING...AND SPREADING SOUTH
AND EAST ACROSS REMAINING PORTIONS OF THE REGION DURING THE
AFTERNOON HOURS.

Much more severe or extreme weather is expected today accross
most of the Southern Territory. Check with your local NWS office
or local weather service for details in your area.

I'm curious. I have <WX> in my macro. Where or how would I pick up the weather bulletin for example Vancouver, BC. Such as described below.

Is this a cut paste from Email. My HF Station is up and running. I sure like to see NBEMS on 40 m. Most of the nets in my area are on 80 m. 80 m goes long and signals don't reach us here in Vancouver, BC

Fred,

I'm not familiar with:

Tri State NBEMS net (PA) Saturday 9:30am local 3.9530mhz

That's an LSB phone frequency.

Do you know who is running this net or is this a typo for the paNBEMS 80m net for Sunday mornings on 3.583 USB, 9:30am ET?

Voice of America continues their digital mode broadcast testing with NBEMS / FLDIGI.

All you need is the free software (www.w1hkj.com) and a computer with a working sound card and either a built in or plug in mic.

Tune in and give it a try!

Subject: [NBEMSham] thor

VOA Radiogram will feature Thor digital text modes this weekend, with MFSK modes also transmitted for comparison. Details here:

voaradiogram.net/post/48358773399/voa-radiogram-april-20-21-will-feature-thor-modes

The Mighty KBC will also compare Thor and KBC with a simultaneous transmission. More information:

voaradiogram.net/post/48432804632/thor22-versus-mfsk22-this-weekend-on-the-mighty-kbc

5632. Receiving KD2DO but KB3FXI drowned out

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-04-21 14:57:01 UTC
From: Sander Pool
Topic: 5632 Message: 5632

Hi,

I'm not sure what kind of interference I'm hearing on 40m today but it was doing a number on the net. I got partial receives from Dave KB3FXI who I normally receive very well. I'm receiving Paul KD2DO quite well. The Thor FLAMP session happening right now (10:55 EST) is rolling in at about -1, 0 dB.

The noise frankly sounds like wind whipping through trees.

I received the .csv 100%. Cool.

73,

Sander W1SOP

Fred,

I'm not familiar with:

Tri State NBEMS net (PA) Saturday 9:30am local 3.9530mhz

That's an LSB phone frequency.

Do you know who is running this net or is this a typo for the paNBEMS 80m net for Sunday mornings on 3.583 USB, 9:30am ET?

-Dave, KB3FXI

Hi

I have station set up after the move. I know my signal is reaching the east as I've had a PSK contacts. Even Nova Scotia coming across.

My problem is that these nets are on 80 m. I have no local NBEMS nets close. I can't reach Southern California at 20:30 pm BC time. Now that summer is sort of here. 80 out.

If you see my cq on the waterfall give me a holler. (7.072.5 & 14.065)

Hi

I have station set up after the move. I know my signal is reaching the east as I've had a PSK contacts. Even Nova Scotia coming across.

My problem is that these nets are on 80 m. I have no local NBEMS nets close. I can't reach Southern California at 20:30 pm BC time. Now that summer is sort of here. 80 out.

If you see my cq on the waterfall give me a holler. (7.072.5 & 14.065)

5642. Req for Amateur Radio Operator assistance with missing person search Warren PA

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-04-23 03:15:21 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5642 Message: 5642

Below is a news clip that sheds a little more light on this story.

-Dave, KB3FXI

http://www.timesobserver.com/page/content.detail/id/563930/New-Search-Planned.html

New Search Planned
Volunteers to look for missing man

April 18, 2013
By JOSH COTTON (jcotton@...) , The Times Observer
Save | Post a comment |
A tentative date has been set for a search for the North Warren man who has been missing since last month.

According to a statement from the Chief Cornplanter Council of the Boy Scouts, a search is being planned for Sunday, April 28 to continue efforts to find 69-year-old Dan Wolboldt, who was last seen on March 22 near his home.

"People have been expressing concern wanting to help out," Buster Godden, who is coordinating the search, said Wednesday. "This is a good way to help."

Weather and river levels will have an impact on whether the search is held.

"The water is really too high to do something right now," Godden explained. "(We're) hoping by the 28th it's settled down. (It) makes maneuvering a little easier and visibility in the water better."

The search will be two-pronged.

The land phase of the search will commence at camp master cabin at Camp Olmsted in Scandia at 8 a.m.

The water phase of the search will be by canoe "and other water craft" and will traverse the Conewango Creek, Allegheny River from the Conewango to Betts Park, and the Starbrick boat launch to Buckaloons.

When asked why those locations were selected, Godden said "they're just logical places." He said that the water component is a "continuation of the original search on the river" and they "want to give Olmsted a good going over."

"The search is not being sponsored by the Scouts," according to the press release, "but they are lending their full support by providing their canoes to Buster and anyone wishing to help search. While not officially sponsoring the search, the Council hopes that many of their adult members will volunteer to help in the search, either by land or water."

All volunteers interested in participating in the search must be at least 18 years of age. Liability is part of the concern but Godden also said the decision is "just the nature of the thing in case they'd find something."

Wolboldt is the Scoutmaster of Boy Scout Troop 13 of North Warren.

Hello all,

If anyone on the list is interested in FLAMP testing of a new alpha vs, and you're within NVIS range of Pittsburgh PA on 40m or if you can hit the 145.51 FM Simplex repeater in Eastern OH, please drop me an email at kb3fxi at yahoo dot com and we can set up a test schedule.

Thanks in advance.

5645. HRD Software

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-04-23 21:19:51 UTC
From: Fred VE3FAL
Topic: 5645 Message: 5645

I guess I have been out of the loop for a while now.

I am testing the newest Chinese HF QRP Rig the X1M, put it through the paces on cw today and was going to check it out using HRD. Because I use FLDIG for all rig control and software I never thought anything about it, man was I surprised to see that you have to buy the newest version after 30 days, there are free ones still available but wow. This has been around for a long time this software.

I never really liked the software as I found it really slowed my laptops down.

Just was not sure if anyone had made note of this, like I say been with FKDIGI and never looked back..

I am sure it will also control the X1M using the IC-718 settings.

Last time I looked, the pay version had lots of features that, if you could use them all, would probably be worth the money. The free version with fewer features still has more than I use.

Fred,

HRD always seemed to be geared toward the contesters and dx'rs. I had it running several years ago but never liked the layout. I'm sure it's just a matter of getting used to, but I didn't like all the different windows up all over the place.

NBEMS, of course, is really geared much more for emcomm and has features for messaging and file transfers that no other pay or free packages offer.

We're REALLY lucky to have such a dedicated guy in w1hkj to do all the work he does on the NBEMS project.

I did some of the first FLAMP 2.0.00 alpha testing today and in spite of some bugs, I think FLAMP is really going to shape up to be the next big game-changer, just like FLMSG.

I just wish we could get more new folks involved in NBEMS but I have some ideas on how to do that and hope to enact some plan with that regard later this year.

Highly recommend N1MM CONTEST SOFTWARE for contests. Its free. Its not easy to set up, but once set up, you can marry it to FLdigi for cw and other digi modes. Even if you only contest for a couple of hours, you will enjoy it more if you can do it efficiently .

I'm a little confused as to why they say this rig can be connected directly to HRD.

Is there some sort of firmware in the rig that simplifies or optimizes the use of this qrp transceiver with HRD or is it just that their marketing team used the reference to HRD to help with sales.

Any rig with a mic connector will work with any of the many sound card digital mode software packages, including HRD and NBEMS/FLDIGI.

The X1M has an RS232 port on the back and is supposed to run off the HRD software for rig control.

It is supposed to use the IC-718 settings.

But so far tonight I have been unable to get the two to communicate.

I made contacts yesterday and today on 20,17 and 15 from NY,TN,CO, and Italy.

Trying to finish up my review on the rig and wanted to try the HRD software to see how it will perform.

Subject: Re: [paNBEMS] HRD Software

I'm a little confused as to why they say this rig can be connected directly to HRD.

Is there some sort of firmware in the rig that simplifies or optimizes the use of this qrp transceiver with HRD or is it just that their marketing team used the reference to HRD to help with sales.

Any rig with a mic connector will work with any of the many sound card digital mode software packages, including HRD and NBEMS/FLDIGI.

The X1M has an RS232 port on the back and is supposed to run off the HRD software for rig control.

It is supposed to use the IC-718 settings.

But so far tonight I have been unable to get the two to communicate.

I made contacts yesterday and today on 20,17 and 15 from NY,TN,CO, and Italy…

Trying to finish up my review on the rig and wanted to try the HRD software to see how it will perform.

I have downloaded FLAMP ver 2
Currently I use FLdigi ver ...70
Flamp works fine and transmits files in Flamp ok
When I want to add a file to FLAMP that is not in the FLAMP File, FLAMP
will not respond when I click on Dir Documents Flamp freezes
I have to move the Text file from Documents to Flamp files.
Before I didn't have to do this
Anyone else have this problem ???

Subject: Special Announcement: Space Weather Impacts Survey

The NOAA Space Weather Prediction Center (SWPC) has been asked to make you aware of a space weather survey being conducted by the Lockheed Martin Solar and Astrophysics Lab (LMSAL). By participating in this survey, you can provide valuable feedback that may enhance space weather information and services and improve civil society's long-term resilience to the impacts of the space environment.

This survey will help LMSAL evaluate which sectors of society are impacted by space weather and how severe the impacts are. LMSAL will provide the results to anyone who requests them and will publish the key findings of the survey for general use and make it publicly available to assist in assessing the value and importance of space weather services.

SWPC has not sponsored this survey nor is it involved in any way other than to provide notice of its existence. The survey is completely anonymous - no respondent information will be tracked - and will be used only to assess the impacts of space weather. You can access the survey by visiting
http://www.surveygizmo.com/s3/1207430/impacts-of-space-weather

I just went through the adding a files to Ver 2 FLAMP
I am running Windows 7 Pro Op sys
When the window opens to the files
on the left margin there is Libraries tag underneath is Documents, etc
If I click on Documents here the window freezes and FLAMP will
not respond and must be closed

Ok,
If I open (click on) Drive C:/ and open any directories all is fine
everything works I can go though the directories to C:/Documents
open it and select the file with no problem

Problem solved

Subject: VOA Radiogram for the weekend of April 27-28

Hello friends,

One of the text transmissions on VOA Radiogram this weekend (April 27-28) will be in the Flamp format. If you don’t already have it, please download Flamp from www.w1hkj.com . Flamp divides a text file into several blocks, each with a specific number of characters. If any block is received without the correct number of characters, that block is rejected. The missing block can be picked up during the repeat transmission. Flamp might be useful for those text transmissions that are received at about 90% copy, when occasional deep fades prevent 100% copy.

These notes about Flamp:

• In Flamp, under Configure, check both of the Auto sync boxes.
• Flamp should be running when the news item in Flamp format is transmitted. It does not turn on automatically when a Flamp transmission occurs.
• At the end of the first or second transmission, you will see the VOA news story as a html file in the Receive Queue. Save that file and open it in your browser. It will not pop up automatically like Flmsg.

Here is the lineup for the April 27/28 VOA Radiogram:

MFSK16 (58 wpm) program preview
PSK63F (55 wpm), 2:50
MFSK32 text (120 wpm) and image, 4:28
Thor50x1 (180wpm), 1:48
Thor50x2 (180wpm), 1:46
MFSK64 (240 wpm), 2:16
MFSK128* in Flamp X2 format, 3:46
MFSK32 image

*Probably a good idea to set the MFSK128 mode manually rather than depend on the RSID

All modes will be centered on 1500 Hz.

Each mode will be introduced by a brief MFSK16 transmission, same as last weekend.

Please send reception reports to radiogram@...

Twitter: @VOARadiogram

VOA Radiogram transmission schedule

(all days and times UTC)
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1300-1330 6095 kHz
Sun 1930-2000 15670 kHz

I hope you can join us this weekend.

All via the Edward R. Murrow transmitting station in North Carolina.

Kim

Sent: Monday, April 29, 2013 8:37 AM
Subject: [wpaares] Search Report

This from Dave Wellman, EC Erie. I am sure the effort of the amateurs that assisted was appreciated and was helpful. The victim's family has closure. Thanks to all who participated and set a great example.
-Larry AB3ER

We had 14 Amateur Radio operators participate in the search. Communications were on 146.52 MHz simplex with hand-helds in the field and three mobile "relay units" placed on hill tops along the area. Use of a repeater was offered and the PL was turned off, but it proved to be difficult to access even at the pre-search assembly point. Tactical calls were used: Camp Base, Team 1, 2, 3, 4 and Relay 1, 2, 3. The search ended just before 11 AM, and all were instructed to return to the base and sign back in. It was discovered that we were missing one person and a second search began lasting just over 2 hours.

Overall, things went well. I think all of those involved learned a great deal from this experience and will be better prepared for future searches. I felt this was an excellent training opportunity where teams were not under pressure due to time as you might be when looking for a child or an adult with health issues and we were able to explain various techniques etc. Our operators were also able to see the importance of a net control / directed net as opposed to the constant chatter on the FRS radios.

Body Found Believed to be Missing Warren Man
Posted: Apr 28, 2013 4:56 PM EDT Updated: Apr 28, 2013 4:56 PM EDT
By Emily Welsh - email

The month long search for missing Warren scout master Dan Wolboldt, has ended.
Searchers found what they believe to be his body on Sunday in Conewango Creek, during an organized search.
Our crews were in warren today, just as the news broke.
Those who spent the last month searching and praying for Wolboldt held out hope that he would be found alive.
"I think all of us have been hoping for the best but knowing that it might not end that way," said Buddy Ward, the pastor at North Warren Presbyterian Church where Wolboldt was a member.
But during a Saturday morning search, their worst fears were confirmed.

Searchers found the body in the Conewango Creek by the 5th Avenue bridge. It's within miles of Wolboldt's home, and the creek runs through his backyard.
Rescue workers pulled a body from the creek just after noon, three hours after an organized search began, with volunteers scouring land and water for the 69-year- old.
Ward got the news after praying for Wolboldt at Sunday mass.
"It wasn't until after the service," he said, "one of the congregation members had gotten a text from her husband who was on the team."
Ward said the past month has been a trying time for the entire community.
"Being someone especially as prominent as Dan, acting as a chaplain and as our scout leader... in many ways it's been difficult for all of us."
It will be especially tough for the young Boy Scouts, who miss their beloved Scout Master.
"We've been meeting with them every week to answer any questions or anything that they might have, and it's been good to be able to have that," said Ward.
Even though the result of the search was a hard hitting reality, Ward hopes it will start to bring some closure to a community in mourning.
"It brings some closure to it, but unfortunately a sad ending," he said.
According to District Attorney Ross McKeirnan, an autopsy is scheduled for Monday.

5668. FLAMP 2.0.0 Alpha Testing and Basic Training PPT's and Videos

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-04-29 18:29:36 UTC
From: David Kleber
Topic: 5668 Message: 5668

Hello all,

Limited testing with the FLAMP 2.0.0 alpha has been going well.

I will be on the air tomorrow (Tue 4/30/13) and Wed (5/1/13) from about 10am to 5pm ET, primarily on 7.0725 USB.

If anyone would like to help test, please drop me a line at kb3fxi at yahoo dot com and we can arrange a schedule. I can also work 10m, 20m, 30m and 80m.

On the subject of Basic NBEMS Training Power Points... I'll be making some minor changes/updates to the Basic NBEMS Install/Setup and the Basic Montoring/Copying Power Points. I'll also be adding a new basic NBEMS power points geared toward new and users for their first QSO. After that one is complete, I will be doing 3 additional power points; one on FLMSG, one on Macros and the other on FLAMP.

I will also be working on a few new video tutorials that I will make available on youtube. One will be on FLAMP and the other will be on creating desktop file folder shortcuts to help with data management, now that we have the tools to move a lot of files over the air.

I'll be sure to update the list when the new materials will be made available.

As always, feel free to post any questions, comments or suggestions here on the list.

73, and maybe see you on the waterfall Tue and Wed.

5676. Tue Apr 30, 2013 FLAMP test - update

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-04-30 16:07:35 UTC
From: KB3FXI
Topic: 5676 Message: 5676

Hello all,

40m 7.0725 USB is not playing so well today so I'm going to head up to the Skyview Radio Society (K3MJW/WX3SKY - www.skyviewradio.net) to run the club station under WX3SKY.

I will be monitoring 14.065, 10.135 and 7.0725 from the station up there
from about 1-5pm ET. Please use 1500 Hz center waterfall and olivia 8/500 for the initial call.

I'll try to do a bulletin on 20m at 2pm and on 30m at 3pm ET with a short message in FLMSG on olivia 8/500 followed by a short FLAMP file with Thor 50x1.

Feel free to jump on any or all of these spots as I'll have the 3 HF rigs all set to monitor. I'll also be listening on the 145.51 simplex repeater which is located in Western OH.

I will be using FLAMP alpha vs 2.0.0:
flamp-2.0.00 is available for testing at:

http://www.w1hkj.com/alpha/flamp/

Help files for this version accessible from the Help/On help menu item or at

http://www.w1hkj.com/flamp2.0-help/index.html

NOTE: THIS VERSION IS NOT COMPATIBLE WITH version 1.x DO NOT MIX VERSIONS WHEN TESTING.

You can read more about the updated AMP protocol here

http://www.w1hkj.com/alpha/flamp/Amp-2.V3.0.Specification.html

Well, the last two days were pretty rough on 40m. But we had some good testing of the NBEMS FLAMP 2.0.00 alpha nonetheless.

George, I could just barely copy you on 20m yesterday from the Skyview Radio Society (wx3sky) but I had pretty good copy on kk5vd, who I think had decent copy on you. WB0KGN was good copy into WPA and we had a successful FLAMP test along with KK5VD.

Earlier yesterday I had some successful testing on 40m with N3FLL.

All the features and improvements on FLAMP in the new alpha seem to be working well.

I think Robert, KK5VD, may be making a few more changes and maybe we'll see a new major release of FLAMP sometime soon.

Keep in mind that the current alpha and the eventual new release of FLAMP will not be backward compatible to the previous versions.

Thanks to all who checked in for testing and special thanks to KK5VD for all your work on the programming end of things.

Paul,

I've been using the 2x "Hdr Rpt" setting and it looks like it's working much better than on the standard release. I noticed that the 2x Hdr Rpt would occasionally result in no received blocks in testing on fairly solid paths with the standard release FLAMP's but is now working much better on the alpha. You still need enough of a path to get enough of a copy on one of the two repeats, of course, in order for FLAMP to start its process in trying to decode the subsequent checksum block transmission.

Perhaps one thing we may want to test are some short flamp file transmissions with slower modes and multiple header and file repeats with short blocks (maybe 16 or 32). I'm thinking of possibly testing this with PSK125R (the single carrier mode), Olivia 4/500, Olivia 8/500, Thor16 and Thor 50x1. The problem with PSK125R is you have to be pretty close to dead on waterfall tuning while Olivia and Thor both provide a lot of forgiveness on the waterfall tuning.

5684. Alpha Testing - Major revisions to Alpha vs's FLDIGI, FLAMP and FLMSG

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-05-03 15:29:51 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5684 Message: 5684

Changes have been made to the Alpha test versions of NBEMS.

For those involved in the alpha testing, these changes require that the three principal NBEMS programs, fldigi, flamp and flmsg be updated as a group. Testing of NBEMS file transfers requires that all stations must be using these revisions:

fldigi - version 3.21.70AG
flamp - version 2.0.00AE
flmsg - version 1.1.30AF

For those willing to pitch in on Alpha testing, and you have not already received an email from me, please drop a line to kb3fxi at yahoo dot com for detailed info on the changes.

I will be monitoring 7.0725 USB today (Friday May 3, 2013).

It looks like we are getting close to final revisions for standard releases. So far, the alpha testing has shown great improvements in performance, along with some critical bug fixes.

I think once the final releases are out, we're going to see FLAMP take off in popularity.

Thanks to all from paNBEMS who have helped with the alpha testing so far. We can always use more help, so please consider pitching in on the testing and check in with us on our weekly nets.

Dave, as a pretty new user, only after the VOA radiogram experiments, no counterstations, using Flamp I think of some Hdr Rpts as the MAJOUR critical element. Why not do as WINMOR, make all "negotiations" in the most robust mode available?

In Winmor it is always 2car4fsk, even if longer transmissions gradually automatically can gear up into 8car16psk.

According to the ongoing VOA radiogram testings, it would indicate perhaps always MFSK 16, regardless which mode you actually are intending to use for the very file transfers?

Is this what you tend to decide after experiments?

Finn,

The major difference with FLAMP and Winmor is that our type of operations with NBEMS are that we are usually trying to convey informational bulletins to more than just one other station. Using "human error correction" we try to decide on the best mode and protocol for the given band conditions and the signal reports we get from the intended designated recipients. It can be a tough balancing act but it's fun and challenging at the same time.

And this gets me thinking... maybe since the header data is the achilles' heel in the FLAMP protocol, we could send the header data in a slow/robust mode then follow with a faster mode for the individual checksum blocks.

Dave, as a pretty new user, only after the VOA radiogram experiments, no counterstations, using Flamp I think of some Hdr Rpts as the MAJOUR critical element. Why not do as WINMOR, make all "negotiations" in the most robust mode available?

In Winmor it is always 2car4fsk, even if longer transmissions gradually automatically can gear up into 8car16psk.

According to the ongoing VOA radiogram testings, it would indicate perhaps always MFSK 16, regardless which mode you actually are intending to use for the very file transfers?

Is this what you tend to decide after experiments?

> I've been using the 2x "Hdr Rpt" setting and it looks like it's working much better than on the standard release. I noticed that the 2x Hdr Rpt would occasionally result in no received blocks in testing on fairly solid paths with the standard release FLAMP's but is now working much better on the alpha. You still need enough of a path to get enough of a copy on one of the two repeats, of course, in order for FLAMP to start its process in trying to decode the subsequent checksum block transmission.
>
> Perhaps one thing we may want to test are some short flamp file transmissions with slower modes and multiple header and file repeats with short blocks (maybe 16 or 32). I'm thinking

of possibly testing this with PSK125R (the single carrier mode), Olivia 4/500, Olivia 8/500, Thor16 and Thor 50x1. The problem with PSK125R is you have to be pretty close to dead on waterfall tuning while Olivia and Thor both provide a lot of forgiveness on the waterfall tuning.

Dave. Yes I have gradually understood the multicast/broadcast intentions, still keeping checksums and compression. The word "negotiation" in Winmor in reality is nothing else than the most critical Achilles heel in the whole session. A failure, ends up in no session (= "no decoded performed transmission" = a failure, and not a word read as if a block is missing. And one of the receivers perhaps doesn't know what filename to ask for a resent block.)

So yes, this "element from WINMOR thinking" is kind of directly transferable.

The time "lost" during slow "short crucial negotiation part" probably pretty quickly in average is gained in by less asking for repeats of the whole session.

5697. Re: Alpha Testing - Major revisions to Alpha vs's FLDIGI, FLAMP and FLMSG

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-05-04 11:16:32 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5684 Message: 5697

WB0KGN and I on 40m experienced some trouble with FLAMP testing yesterday where the header was not being properly detected.

The good news is that I passed the report to W1HKJ and he was able to duplicate the bug and we should be seeing a revision to the alpha vs soon.

For now, we can suspend alpha testing and stick with the standard release versions of FLDIGI, FLAMP and FLMSG.

Special thanks to KD2DO, N3FLL and WB0KGN who helped in the testing yesterday.

Thanks for the info. I wonder, during this Flamp Alpha, Could it be made possible when using Flamp entering a choosable time switch for a mini carrier break?

Auto break: After so many minutes, and so many seconds long.

Purpose is enabling a possibility adjusting for running bigger files through FM voice repeaters without risk of being closed down due to timers?

That could be handy in case of emergency if the repeater sysop is away or no one can disable the timer.

Finn,

I'm not that familiar with the IARU form but w1hkj has taken pretty good care to accurately duplicate such formats.

I might suggest you join and post to the NBEMSham yahoo group as there are many more international hams on that list who might be able to offer some better insight.

Attachments: 1 described; binary payloads are missing from this source WARC

Yesterday I tried to add a file to transmit by FLAMP and it would not let me chose the file I wanted.
After playing around I found out that the file had to have a more then just a file name
the file I wanted was called "ARES11" it would not let me send it
I changed the file to "ARES11.txt" and had no problem with it accepting it.

Thanks, Bill.

BTW, FLAMP and FLDIGI are now both "AG" for the alpha testing.

The AF version doesn't seem to work on receive but with fixed in AG.

I hope to get a good round of testing in on my next day off this Wednesday.

5708. McKean & Potter County NBEMS Event and ARES Meeting

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-05-08 10:06:54 UTC
From: John Szwarc
Topic: 5708 Message: 5708

To all hams residing in McKean County or Potter County....

On Saturday May 11th there will be a ARES Meeting and NBEMS Training Event at the McKean County 911 Center, 17175 Route 6, Smethport, PA. The meeting will start at 9 AM and conclude by 12 Noon.

The agenda includes:

1. A Hands-On NBEMS Event presented by Harry Bloomberg W3YJ
Bring your laptop for this hands-on event. NBEMS is the standard digital software for WPA ARES operations. Harry will assist everyone with installing
the latest version of the NBEMS software and everyone will have the opportunity to send NBEMS messages.

2. Meet and Greet with ARRL WPA Section Officials and ARES Team
The ARRL's WPA Section Leadership Team will give a brief overview of current
happenings that affect WPA hams and allow for a Question and Answer session
from the audience.

ARRL Officials Planning to Attend include Larry Keller AB3ER Acting WPA Section Manager and WPA Section ARES Emergency Coordinator, Harry Bloomberg W3YJ WPA ARES Assistant Emergency Coordinator, John Szwarc N3SPW WPA North 2 District Emergency Coordinator.

If you live in McKean or Potter County we would live to see you there.

5711. FLDIGI 3.21.71 and FLMSG 1.1.30 posted

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-05-09 14:27:25 UTC
From: David Kleber
Topic: 5711 Message: 5711

Major updates to FLDIGI and FLMSG.

The newest versions of FLDIGI (3.21.71) and FLMSG (1.1.30) are available for download. paNBEMS recommends updating to the current versions.

FLDIGI 3.21.71 is designed to work with the current FLAMP alpha.

Here is the download page:
http://w1hkj.com/download.html

FLDIGI now has the MT63 mode variations for short and long interleave as separate modes. This eliminates the issue of having to access the configure/modems menu to switch between short and long interleave settings. MT63 long interleave is the standard for paNBEMS and almost all MT63 operations.

There was a bug in FLDIGI and FLMSG that has been resolved. In the previous versions, if more than about 3 or 4 FLMSG messages were received and left opened, when a station would try to transmit with MT63 or the PSK Mulitcarrier modes, the audio would pulse, resulting in very poor decode at the receiving stations.

Also note that the Configure/ID's menu window has changed.

FLMSG has been updated to include ICS form 309 and an update to ICS-205.

Here is the technical description of changes made by the programmers:

FLMSG 3.21.71 (changes from 3.21.70):

About update
* Updated list of principal developers

ARQ server
* Changed ARQ server / client management.
- old implementation would cause Tx audio stream to be
interrupted by client services.

Wavefile generate
* Fixed menu item toggle when File i/o only selected on sound
card configuration dialog

MT63 mode selection
* Changed to specifed short/long MT63 mode selection
ie: MT63-500S / MT63-500L; MT63-1000S / MT63-1000L;
MT63-2000S / MT63-2000S
* Interleave no longer a configuration item, but fixed by mode
selection
S - short, 32 bit
L - long, 64 bit

xmlrpc-c removal
* Replaced xmlrpc-c by embedded xmlrpcpp

Signal Browser Colors
* Added color initialization when instantiating mainViewer

QRZ query
* Added LOG_DEBUG statement to allow user to review query and
response strings sent / received from QRZ, Hamcall, HamQTH etc.
* Improved fields parsing for QRZ and HamQTH data response

Rigsupport
* Removed Fl::lock/unlock calls from source

PO file update
* Updated es.po and pl.po

eQSL url
* Added suppression of CR/LF, control characters and characters >
0x7e from the eQSL url string.

PSKMAIL
* Test changes to avoid pskmail lockup for certain control code

FLMSG 1.1.30 (includes the following changes from 1.1.29):
String_c

      * Change use of fl_string internal definition to be dependent
        on MAJOR, MINOR, and PATCH associated with FLTK library
        used to build the application

MT63 Mode changes
      * update menu and fldigi interface for MT63 mode designator
        changes

XML status queries
      * Increased status query interval to 5 seconds

CRLF
      * Try to correct bogus CRLF's inserted into text by transport
        layers such as a Packet interface designed to work on Windows.

ICS-205 - updated
ICS-309 - added

Argument parsing
      * Fixed incorrect parsing of --flmsg-dir

IN/EEI report
      * Modified assignment of roster list values to TO, FM, INFO
        fields
        - if not empty the billet call is assigned to the TO and INFO
          lines
        - otherwise the call is assigned

Control cursor
      * Added cursor reposition to Radiogram controls

THOR mode update
      * Changed mode table for fldigi...EXP compliance

5712. Fw: flamp-2.0.00 posted

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-05-11 01:57:44 UTC
From: David Kleber
Topic: 5712 Message: 5712

Hello all,

The new standard release of FLAMP came out quicker than I thought and was just made available for download earlier today.

Testing on the alpha went very well and we now have a new standard release of FLAMP based on the most recent alpha.

IMPORTANT!

The new FLAMP 2.0.00 is NOT compatible with the previous standard release versions of FLAMP. There were bugs in the previous versions that necessitated a rework of the application. Please spread the word to all email lists, nets and groups who have been using FLAMP to uninstal their previous versions and replace with the new FLAMP release, as well as updating to all the new standard releases of FLDIGI and FLMSG, all of which are available at: http://www.w1hkj.com/download.html

Thanks to all our paNBEMS volunteers who helped with the alpha testing. We provided valuable data for the alpha team and the programmers by catching some bugs before this major new release.

This is a really good annual exercise.

Visit the link above and exercise the 2nd VFO on your HF rig to make some contacts.

Also, try to see how many of the broadcasts of the digital Secretary of Defense bulletin you can receive.

Please pass the word and keep the MARS volunteers busy for this event!

Before I had to leave for work this morning, I had a little radio chat with the Pentagon!

Bruce was operating station WAR on 4018 KHz. I was probably one of his first few contacts at 8:05am ET.

I'm looking forward to working more of the Mil stations tonight when I get home.

Get on the air today, work the split, and support the MARS folks for in this fun exercise. And, don't forget to try to copy the digital bulletins from the Secretary of Defense.

I've been following transmissions on RTTY and MT63 and have copied quite a few. AAZ is up now but I can't quite read it. I hear some RTTY far up the waterfall but can't decode it. The MT63 does better, not surprisingly. Also hearing quite a bit of interference with music and spoken word (seems Chinese) on the NBL frequencies. Nice event!

I haven't tried to make any QSOs.

The modes being used are all over the map. Narrow and wide RTTY, 1000 and 2000 wide MT63 and except for one station no RSID. The announcement page only says RTTY and MT63. Offsets also aren't standardized. Have seen +1000, +1500 and +2000.

Good thing this isn't being sent in anger because that would be problematic :-)

Currently reading RTTY-45 on 6.910 + 2000 from AAZ.

Hello all,

I'll be monitoring 7.0725 USB through the day on olivia 8/500 at 1500 Hz Center Waterfall unless I have thunderstorms here in the Pittsburgh Area.

I'd like to test FLAMP with Thor 50x1 and 4xPSK125R as well as a new FLDIGI alpha that seems to be showing some improvements on RSID reception.

The newest FLDIGI alpha, 3.21.71AD, is available at:
http://www.w1hkj.com/alpha/fldigi/v3.21/

Keep in mind that the current FLAMP version (FLAMP 2.0.00) is not backward compatible with previous versions. The newest FLAMP is available for download at:
http://w1hkj.com/download.html

5725. RFI and the local power company

Yahoo group: paNBEMS (2012 — 2018)

From: David Kleber
Topic: 5725 Message: 5725

Hello all,

Here some advice on dealing with Radio Frequency Interference (RFI) from your local power company, based on my experience.

If you have bad static bursts on HF, go to AM mode on your HF receive and check to see if you are seeing/hearing the same interference all the way up and down the HF bands.

Most RFI from the power companies is a result of broken insulators and bad/loose electrical connections, including lightning arrestors. Interference from transformers is rare.

RFI interference is often reduced or eliminated during times of high humidity and/or rain, when the bad electrical connections are quieted by moisture.

Once you identify static burst interference through the entire HF spectrum, you most likely have a legitimate reason to file a complaint with your local power company. And, if it is the case in your instance, make sure you detail that the interference subsides when it rains.

Call your power company and be polite. Be specific on the nature of your complaint. Tell them that you are experiencing interference through the entire HF spectrum.

If you have a legitimate complaint, it is the responsibility of the power company to resolve the issue.

Make sure you detail all your communications and complaints. In the event that the issue is not properly resolved, as a LAST RESORT, after giving your local power company every reasonable chance to resolve the problem, and the issue is not resolved, contact the FCC and give them all the details of your communications with the power company.

In a previous instance, about 5 years ago, when I did not get proper resolution from the local power company, I actually made audio recordings of the interference at various spots on the HF spectrum and submitted those files to the FCC investigator by email file attachments, which helped convince him that I had a legitimate complaint. Not surprisingly, after the FCC contacted the power utility company, the issue was quickly resolved.

Since my last complaint, we have a new line manager who was prompt and polite. The RFI sweep team showed up within a week and confirmed my complaint and yesterday and today (about 2 weeks later) the crews were out with 3 bucket trucks and replaced the culprit today... a "fried" (that was their term) lightning connector.

Be polite but persistent and keep good records.

I had a nice chat with 4 of the the power company crew who were working on the line problems near my location. One fellow in particular had a lot of cool questions about ham radio. Who knows, maybe he'll go for his ticket!

Dear all,

Also look at it on fldigi waterfall and expaned to, say, X 4 and use the cursor to measure the ‘lines’ , they should be 60 or 180 hz apart if it’s ac sparking generating harmonics of 60 hz and of course, depending on the rx antenna, it should be stronger on the lower frequencies but it depends on what resonances the harmonic energy couples with at the source, depending on the physical makeup. Every 60 hz is broadband so a lot of harmonics and resonances will be excited if bad connections plus any resonances at the source are present.

Also driving the road and listening to AM radio on a clear frequency helps narrow the source.

Cold weather pulls joints apart, cold winter mornings are sometimes very noisy, even on vhf/uhf sites.

The power company does not recommend banging on poles with sledgehammers while listening to AM radios to try and find if the suspected site has loose connections. Also something loose and alive could come down and the poles are usually the property of the power company so please don’t squeeze the charmin HI HI.

I think Dave has some super ideas.

Thanks Dave.

Right on, Rolan... don't go tugging on pole guy wirers or banging on the poles with sledge hammers.

Leave those high-tech methods for the power company pro's. And they do use these techniques!

Hi,

I received 5 files in total, 'what can go wrong' was received 98%, one block missing. A second file missed 2 blocks. Ready testing and really.txt were received 100%.

As I came to the radio I heard Feldhell and has a nice QSO with KC9UMP who's only 9 years old. Impressive!

Now I hear a pretty consistent 'brap brap brap' at about 14.0645 + 200. Very odd.

Dave,
I downloaded the latest FLdigi AF and installed it in the Program directory
With the last OS XP pro I always installed the programs in the root
directory
because of the OS changing some of the codec with 2 or 3 fldigi's open.
I run more then one fLdigi at one time I can move msg's from HF to VHF
back to HF
I changed OS to Windows 7 pro and installed the programs agn in the root
when I would move the cursor down and into the bottom tool it would close
the running program. Today I installed the lastest FLdigi in the program
directory
and I have no problem with the cursor position. Problem solved

comment from NCS...

newest release of FLDIGI is out which is 3.21.72
this is not a critical update from .71 but it
has improvements on RSID detect (RxID).
w1hkj.com download site has the newest vs of
FLDIGI, FLMSG and FLAMP which are all recommended
for current use. Keep in mind that FLAMP 2.0.00
is a critical update if you have not already
installed it. FLAMP 2.0.00 has major improvements
and bug fixes but it is NOT compatible with
previous versions, so it's important for us
to spread the word for all using FLAMP to go
to www.w1hkj.com to get the current version.

Thanks to all for checking in. Light turn out
was expected with many of our regulars at, or
recovering from, Dayton Hamvention.

All are invited/encouraged to check in on
Sunday paNBEMS net here at 9:30 AM ET and
on 7.0725 USB at 11 AM ET.

If you use Outlook to email binary files, beforenattaching, change of add a new file extension other than exe.

It does sound like you should be using a browser, as that's is easiest from Dave's download site.

Hello all,

I'm at wx3sky helping with relays for SATERN net in support of OK Tornado recovery.

Net is on 14.065 USB, 1000 Hz center waterfall, 8/500 olivia and MFSK32 with FLAMP.

All are encouraged to check in and help with relays if needed. This is a directed net so please wait for your call from NCS or a NCS designated relay.

If NCS is light copy at your station, only check in once, then wait for relay calls if you are not acknowledged.

So far, there has been no priority traffic and NCS AD5XJ has been sending weather statements/bulletins.

The majority of the traffic is being sent with Olivia 8/500.

If you don't see or hear anything on the waterfall, you must be in a skip zone.

NCS is using RSID.

Hi,

I'm decoding about 95% on O 8/500 and receiving RSID in CT. Perhaps
you're not using fldigi 3.21.72?

AD5XJ is 100% here at WX3SKY but I have a 2 element, 5 band quad pointed right at LA from WPA. At my home station which is strictly NVIS wire, I was only getting about 25% copy at the best.

We sure could use more relays and big gun stations, especially for 40m and 20m digi nets and activations.

Good deal, Gary.

I saw you acknowledged by NCS but no copy of you here on the short skip.

MFSK32 seems to be a good choice for moderate to good conditions on 20m. So far, I've received all of AD5XJ's FLAMP messages 100% on first pass.

US National Weather Service Pittsburgh PA
An organized line of thunderstorms appear possible for our forecast area later this afternoon into the evening for eastern OH, northern WV, and western PA. These storms could potentially reach severe limits. The main threat will be wind. 1-inch or larger diameter hail cannot be ruled out. Please, if you have any reports of hail larger than half an inch, wind damage, or flooding, post a picture of it along with the location and time. Please share this with others so more people are notified and can take necessary steps to prepare if severe weather occurs. We will update with a post later if necessary.

Hello all,

Thanks to all the paNBEMS folks who checked in on the 20m digi SATERN net yesterday on 14.065 1000 Hz center.

AD5XJ in LA was switching between olivia 8/500 for check ins and MFSK32 for FLAMP files.

From my home station with my NVIS low hanging wire, I had only about 25% copy on AD5XJ olivia. So, I went to the WX3SKY club station and worked from there from about 12:30 to 3:30 PM ET with the Lightning Bolt quad. What a difference a good 20m gain antenna makes!

I received 4 FLAMP files from Ken in LA, all 100% on first pass. That was my first time using FLAMP with MFSK32 and I was quite impressed.

After the latest improvements in FLAMP 2.0.00, I think we're going to see many more NBEMS groups successfully working with this file transfer protocol.

Thanks again to all who checked in on the SATERN net activation yesterday. I know that Ken greatly appreciates the help and support.

Hi Dave,

I saw the 4 FLAMP transmissions here in CT but none of them received 100%, best was 70% as I recall. Two wrapped messages also had errors but were still readable. RSID decoding was reliable. By the end of the day I'd seen dozens of those. The station ran unattended as I worked.

Good deal, Sander.

It's pretty cool to come home to the shack and see the activity all recorded while you're away.

I'm sure with some resends, we could have got you to 100% with a relay from WB0KGN in MN.

The more I use FLAMP, the more I see it being an extremely valuable tool for file transfers on both HF and VHF/UHF.

Cool stuff and FLAMP 2.0.00 is working very well.

From: KB3FXI
Topic: 5754 Message: 5754

Hello all,

I just completed updates to the basic NBEMS Power Point presentations for PEMA/ACS which we are making available for general distribution.

The files have been loaded to my pa-sitrep.com site.

I added the links to my www.qrz.com profile (http://qrz.com/db/KB3FXI) for an easy way to point interested individuals and groups to the downloads.

Please test the download links from my QRZ profile to see if downloads work properly from that page.

Once I get a few replies in the affirmative, we'll start encouraging wide distribution.

-Dave, KB3FXI
paNBEMS Founder and PEMA/ACS Digital Manager

Here are the link addresses to go direct to the downloads:

Thanks, Sander.

I did catch an error I made whereby I uploaded a dated version of the "http://www.pa-sitrep.com/NBEMS/NBEMS_Basics_Monitoring_Copying_NBEMS_PEMA_ACS_2013.ppt". I just uploaded the corrected/updated file a few minutes ago. The previous file showed a dated screen shot of the FLDIGI/Configure/ID screen, which changed in FLDIGI a few versions back.

5763. Interfacing MAC pro with Kenwood TS-2000

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-05-24 01:11:03 UTC
From: kb3tox
Topic: 5763 Message: 5763

I am attempting to use the UHF/VHF portion of the TS-2000 for NBEMS. My problem is I am unable to control the TS-2000.

I am using "RigCAT" with the TS-2000.xml file . The interface I am using is a UD01KE attached to "ACC2" on the TS-2000. Audio in and out connected to the mic / speaker on the MAC and the USB connected to the MAC.

I am able to receive with no problem but unable to key the transmitter. I also CANNOT change mode and frequency

Any idea if this is a viable configuration and if so ... how do i get it to do full CAT control

Thanks and 73

No Off. Only on if you want to do packet stuff with the internal TNC.
When you do that you loose any rig control.

In a message dated 5/24/2013 7:53:54 A.M. Pacific Daylight Time,
himself@... writes:

Ken

Menu #55 is OFF..... should it be ON?

Subject: [NBEMSham] Digital images etc 25-26 May via shortwave broadcast

In addition to the usual MFSK text and images this weekend, VOA Radiogram will also experiment with digital images using the EasyPal software. With EasyPal, the picture will either be perfect or nonexistent. Definitely worth a try.

voaradiogram.net/post/51249124390/voa-radiogram-for-the-weekend-of-may-25-26-includes

On The Mighty KBC to North America, 26 May at 0000-0200 UTC on 9925 kHz, at about 0133 UTC MFSK32 text will be centered on 1000 Hz, and an MFSK32 image on 2000 Hz. At just before 0200, MFSK64 text will be centered on 1000 Hz, and an MFSK32 image on 2000 Hz. Run two instances of Fldigi or other decoding software to decode both simultaneously. Turn off the RxID on the 2000 Hz modes.

There will be no Radio Australia digital text tests this weekend, but there will be on 1 and 2 June.

5770. RSID for Thor 50x1 registers as RTTY

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-05-26 16:45:51 UTC
From: Sander Pool
Topic: 5770 Message: 5770

Hi,

it seems I'm not the only one who had fldigi switch to RTTY instead of THOR 50x1. At least when I looked at the log I saw one more mention of that problem.

Did anyone else see the same?

Thanks N3FFL for being NCS today!

Thanks,

Sander W1SOP

Sander,

Are you running FLDIGI 3.21.72? The latest FLDIGI version has noticable improvements on RSID over .71 but I don't think it's ever going to be perfect. In a lot of cases the modes we're running on HF are actually better into the noise than the RSID signal/mode is.

For FLAMP, I think we're all better off disabling RxID and going with manual mode changes. I usually only have RxID on when I'm out of the shack.

And thanks, Frank (N3FLL) for picking up the 40m paNBEMS net today. I'm looking forward to seeing what I copy while I am at work today.

Dave,

yeah, I'm running .72. I understand RSID will never be perfect but I thought it was interesting that at least two stations made the same mistake at the same time. It's like RTTY and THOR have similar RSIDs and that we both lost the same tone.

In any event, I received both FLAMP transmissions. THOR 50x1 seemed very solid to me. It is of course wider than Olivia but since it's quite a bit faster it may be an option for general net traffic.

Hello all,

I'm wondering if anyone will be working this event and what frequencies will be used.

My son, kb3gtj, will be biking the event... 150 miles from Zelienople PA to Conneaut OH.

Anyone want to sponsor my son, check out the link below:

http://main.nationalmssociety.org/site/TR/Bike/PAXBikeEvents?px=8183882&pg=personal&fr_id=20526

5774. Re: RSID for Thor 50x1 registers as RTTY

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-05-31 05:21:31 UTC
From: gwest39
Topic: 5770 Message: 5774

With the new faster modes where two RSID code sequences are sent, the first code is a special code (#263) that indicates that a second RSID code will be sent immediately following and that a second list of RSID definitions should be used to determine what modem it should be. If the first special RSID code (#263) is not decoded properly, but the second RSID is decoded, it will cause Fldigi to select the modem from the first list that shares the same RSID code as the intended modem in the second list.

For instance:

THOR 50x1 has a RSID code of (#263) then (#41)
RTTY 75 has a RSID code of (#41)

If the special RSID code (#263) is not decoded properly, it is the same as if it was never sent. If the second RSID code (#41) is decoded, Fldigi will mistakenly switch to RTTY 75.

Another pair I have experienced RSID sometimes switching to the wrong mode is:

PSK125Rx4 with a RSID code of (#263) then (#10)
MT63 500 Short Interleave with a RSID code of (#10)

Below are the RSID codes from the first and second extended lists in the source code for reference:

```

Date: 2013-06-02 01:36:20 UTC
From: David Kleber
Topic: 5775 Message: 5775
Attachments: 1 described; binary payloads are missing from this source WARC

I'm standing by for the 10pm ET sched.

Cool stuff coming out of the SW Broadcasters.

I wonder if AM Broadcasters in US are permitted to play NBEMS?

Subject: [NBEMSham] MFSK modes, including Flmsg, soon on 9925 kHz

The Mighty KBC, via Nauen, Germany, on 9925 kHz, is putting a good signal into North America.

At about 0133z (9:33 pm EDT) MFSK32 will be centered on 1500 Hz, in Flmsg format.

At just before 0200, MFSK64 will be centered on 1000 Hz, and an MFSK32 image on 2000 Hz. Run two instances of Fldigi, with the RxID off for the MFSK32 on 2000 Hz.

Subject: [NBEMSham] VOA Radiogram today (2 June)

The weekend's third airplay of VOA Radiogram begins soon, at 1300Z, on 6095 kHz. Reception will be best in the eastern USA.

The program will include text in MFSK 16, 32, and 64, as well as images in MFSK32 and EasyPal.

The weekend's fourth and final broadcast will be at 1930Z on 15670. Reception should be best at points beyond the eastern USA.

From: bobmary37
Topic: 5777 Message: 5777

I have the FT950 and I have no problem getting HRD to control the radio. However, fldigi is another story. I have tried all I know to get flrig to communicate with the radio. If someone with a 950 could contact me and give some help with this problem I would be very greatfull.

5778. 6/2/2013 band conds

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-06-02 14:34:07 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5778 Message: 5778

Hello all,

I almost always check in on the PA RACES phone net, 9am ET 3.9935 LSB and conditions were terrible on that net this morning. I knew paNBEMS 80m was going to be rough so we switched to 40m right after the Region 13 call.

I only heard 2 light stations on 40m but had negative copy on text.

As a last ditch effort I switched to our 60m alt freq 5.3465 USB Ch 2.

Some other folks were just wrapping up a qso and gave me the clear spot. The said they had experienced the same cond's this morning, too.

I put out 2-net FLMSG on 60m CH 2 with olivia 8/500 and called for general check ins but nothing was heard.

Keep in mind that our alternate freqs for 80m paNBEMS are:
7.0725 USB
60m (channel 2) 5.3465 USB
60m (channel 4) 5.3715 USB
1500 Hz center freq, and Olivia 8/500 for the initial call.

I'm interested to know if any stations, who may not have 60m TX capability on older rigs, were able to copy the 2-net on 60m.

This morning was the worst band conditions I ever recall on both 80 and 40, most certainly due to the current solar storm.

At about 10:20 AM ET I was on 7.255 LSB ECARS freq and heard a spec event station in MI ack a station in Philly. MI was 599 and couldn't hear a thing from the Philly station.

40m will probably be pretty rough still at 11am ET for the paNBEMS 40m net but we'll see what happens in about 25 minutes.

I got the tune signal at 7072.5+1500 loud and clear here in Central VA, but I'm not getting any decode. Neither my ear nor my eye can detect any Olivia.

I'm catching the occasional RSID and decoding a little Olivia 8/250, but
just a fragment here and there.

Welcome to program 11 of VOA Radiogram. In addition to VOANews
stories in MFSK text modes, we will continue to compare images in
the MFSK32 and digital EasyPal* modes.

Here is the lineup for today's program:

3:53 MFSK16: Program preview
3:17 MFSK32: VOA News story about Olympics wrestling
3:16 MFSK32: VOA News story about 2013 hurricane season
1:10 MFSK32: File image of Atlantic hurricane
2:53 MFSK32: VOA News story about colliding galaxies
1:04 MFSK32: Image of the colliding galaxies
1:21 MFSK32: Introduction to MFSK64 and EasyPal
1:30 MFSK64: Same VOA News story about colliding galaxies
:39 EasyPal text: Same VOA News story about galaxies
2:38 EasyPal image: Colliding galaxies
2:38 EasyPal image: Soyuz capsule being moved to launch site
1:09 MFSK16 closing announcements
:29 Surprise mode of the week

*Download the 04-May-2013 version of EasyPal from vk4aes.com.

Russia Tries to Keep Wrestling in the Olympics

Jessica Golloher
May 28, 2013

MOSCOW — Russia says it will ask the International Olympic Committee (IOC) to keep wrestling in the games. This after the IOC announced it would drop the sport from the 2020 Summer Olympics.

The president of the Russian Wrestling Federation, Mikhail Mamiashvili, says that supporters of wrestling worldwide are coming together to rally behind the sport, which has been in the games since the first modern Olympics in 1896.

Mamiashvili, a former Olympic and European wrestling champion, said that without keeping wrestling in the Olympic family, all our aspirations, all that history and all the heritage will effectively go to dust.

The IOC is a for-profit organization and wrestlers were warned that if the sport wasn't modernized, adapted for a new environment and made for better TV watching, it would be permanently dropped from the games.

At an extraordinary congress of FILA, the international wrestling federation, held in Moscow earlier this month, the organization approved a new set of rules. The guidelines affect both Greco-Roman and freestyle wrestling and include, among other things, a cumulative score for the entire bout, two three-minute periods, and separating returning athletes from previous world championships from other competitors.

Mamiashvili says FILA has done what the IOC has asked.

To put it mildly, we've done everything we could have done for the IOC to pay attention to us, he said. Wrestling is changing,

he said, and wrestlers want to keep pace with modern sports and the modern Olympic movement.

Wrestling will have to compete with other sports, including baseball, wakeboarding, squash and others for a single open spot on the 2020 Olympic schedule. IOC members are expected to meet in St. Petersburg Thursday to make recommendations before a final vote on the issue by the IOC in Buenos Aires in September.

Forecast: More Storms Likely During 2013 Hurricane Season

Rosanne Skirble
May 23, 2013

The 2013 Atlantic Hurricane season could be busier and deadlier than average, according to predictions released Thursday by the National Oceanic and Atmospheric Administration or NOAA.

The six-month seasonal outlook for Atlantic storms will be above average says Jerry Bell, lead Atlantic hurricane forecaster with NOAA’s Climate Prediction Center.

"The outlook is calling for 13 to 20 named storms, of which we expect 7 to 11 to become hurricanes and three to six to become major hurricanes. So this is a lot of activity that we are predicting for this year," Bell said.

These ranges are well above the typical season of 12 named storms, six hurricanes and three major hurricanes. Bell says it is due to a confluence of climatic factors.

"And one of the factors again for this year is those wind and air pressure patterns that have been producing increased activities since 1995 are in place again this year. Another factor that we

associate with more hurricanes is warmer Atlantic ocean temperatures and the Atlantic is again warmer this year," Bell said.

Another factor is the absence of an El Niño weather pattern, the upwelling of warm ocean waters in the eastern Pacific which typically reduces hurricane activity.

NOAA acting Administrator Kathryn Sullivan says the release of the Atlantic Hurricane Season Outlook underscores the need for Americans to prepare for these destructive and often deadly storms. In a statement, Sullivan reminds people that hurricane impacts are not limited to the coastlines. "Strong winds, torrential rain, flooding and tornadoes often threaten inland areas far from where the storm first makes landfall," she said.

For the first time this year, NOAA will transmit Doppler radar data in real time, which will help forecasters better analyze evolving storm conditions.

The Atlantic hurricane season runs from June 1 to November 30.

Telescopes Spot Colliding Galaxies

VOA News
May 23, 2013

Astronomers have gotten a rare glimpse of two distant and ancient galaxies merging.

The galaxies, called HXMM01, are about 11 billion light years from Earth, meaning they offer a look at the universe when it was only 3 billion years old. Inside the massive formation are some 400 billion stars.

Astronomers have long wondered how galaxies grew. When the universe was three to four billion years old, it was believed to have been populated with large reddish elliptical-shaped galaxies

made up of old stars. Scientists wanted to know if those galaxies built up over time or formed through collisions.

According to NASA, HXMM01 suggests that massive mergers of galaxies are responsible for giant elliptical galaxies.

"We're looking at a younger phase in the life of these galaxies -- an adolescent burst of activity that won't last very long," said Hai Fu of the University of California at Irvine, who is lead author of a new study describing the results. The study is published in the May 22 online issue of Nature.

The merging galaxies are massive star factories, creating over 2,000 stars a year, NASA said. The Milky Way gives birth to two or three stars a year by comparison.

NASA said that the merging of galaxies is fairly common, but that HXMM01 is unusual "because of the prolific amounts of gas and star formation, and the sheer size of the merger at such a distant epoch."

HXMM01 was spotted by the Herschel space observatory, a European Space Agency with follow up studies by NASA’s Hubble Space Telescope and Spitzer Space Telescope.

Fred, you had much better luck that I did today in North Texas. I got about half of the text, VOA logo and a noisy copy on the hurricane image.

Welcome to program 11 of VOA Radiogram. In addition to VOANews
stories in MFSK text modes, we will continue to compare images in
the MFSK32 and digital EasyPal* modes.

Here is the lineup for today's program:

3:53   MFSK16: Program preview
3:17   MFSK32: VOA News story about Olympics
wrestling
3:16   MFSK32: VOA News story about 2013 hurricane
season
1:10   MFSK32: File image of Atlantic hurricane
2:53   MFSK32: VOA News story about colliding
galaxies
1:04   MFSK32: Image of the colliding galaxies
1:21   MFSK32: Introduction to MFSK64 and EasyPal
1:30   MFSK64: Same VOA News story about colliding
galaxies
:39   EasyPal text: Same VOA News story about
galaxies
2:38   EasyPal image: Colliding galaxies
2:38   EasyPal image: Soyuz capsule being moved to launch
site
1:09   MFSK16 closing announcements
:29   Surprise mode of the week

*Download the 04-May-2013 version of EasyPal from vk4aes.com.

Russia Tries to Keep Wrestling in the Olympics

Jessica Golloher
May 28, 2013

MOSCOW — Russia says it will ask the International Olympic Committee (IOC) to keep wrestling in the games. This after the IOC announced it would drop the sport from the 2020 Summer Olympics.

The president of the Russian Wrestling Federation, Mikhail Mamiashvili, says that supporters of wrestling worldwide are coming together to rally behind the sport, which has been in the games since the first modern Olympics in 1896.

Mamiashvili, a former Olympic and European wrestling champion, said that without keeping wrestling in the Olympic family, all our aspirations, all that history and all the heritage will effectively go to dust.

The IOC is a for-profit organization and wrestlers were warned that if the sport wasn't modernized, adapted for a new environment and made for better TV watching, it would be permanently dropped from the games.

At an extraordinary congress of FILA, the international wrestling federation, held in Moscow earlier this month, the organization approved a new set of rules. The guidelines affect both Greco-Roman and freestyle wrestling and include, among other things, a cumulative score for the entire bout, two three-minute periods, and separating returning athletes from previous world championships from other competitors.

Mamiashvili says FILA has done what the IOC has asked.

To put it mildly, we've done everything we could have done for the IOC to pay attention to us, he said. Wrestling is changing, he said, and wrestlers want to keep pace with modern sports and the modern Olympic movement.

Wrestling will have to compete with other sports, including baseball, wakeboarding, squash and others for a single open spot on the 2020 Olympic schedule. IOC members are expected to meet in St. Petersburg Thursday to make recommendations before a final vote on the issue by the IOC in Buenos Aires in September.

Forecast: More Storms Likely During 2013 Hurricane Season

Rosanne Skirble
May 23, 2013

The 2013 Atlantic Hurricane season could be busier and deadlier than average, according to predictions released Thursday by the National Oceanic and Atmospheric Administration or NOAA.

The six-month seasonal outlook for Atlantic storms will be above average says Jerry Bell, lead Atlantic hurricane forecaster with NOAA's Climate Prediction Center.

"The outlook is calling for 13 to 20 named storms, of which we expect 7 to 11 to become hurricanes and three to six to become major hurricanes. So this is a lot of activity that we are predicting for this year," Bell said.

These ranges are well above the typical season of 12 named storms, six hurricanes and three major hurricanes. Bell says it is due to a confluence of climatic factors.

"And one of the factors again for this year is those wind and air pressure patterns that have been producing increased activities since 1995 are in place again this year. Another factor that we associate with more hurricanes is warmer Atlantic ocean temperatures and the Atlantic is again warmer this year," Bell said.

Another factor is the absence of an El Niño weather pattern, the upwelling of warm ocean waters in the eastern Pacific which typically reduces hurricane activity.

NOAA acting Administrator Kathryn Sullivan says the release of the Atlantic Hurricane Season Outlook underscores the need for Americans to prepare for these destructive and often deadly storms. In a statement, Sullivan reminds people that hurricane impacts are not limited to the coastlines. "Strong winds, torrential rain, flooding and tornadoes often threaten inland areas far from where the storm first makes landfall," she said.

For the first time this year, NOAA will transmit Doppler radar data in real time, which will help forecasters better analyze evolving storm conditions.

The Atlantic hurricane season runs from June 1 to November 30.

Telescopes Spot Colliding Galaxies

VOA News
May 23, 2013

Astronomers have gotten a rare glimpse of two distant and ancient galaxies merging.

The galaxies, called HXMM01, are about 11 billion light years from Earth, meaning they offer a look at the universe when it was only 3 billion years old. Inside the massive formation are some 400 billion stars.

Astronomers have long wondered how galaxies grew. When the universe was three to four billion years old, it was believed to have been populated with large reddish elliptical-shaped galaxies made up of old stars. Scientists wanted to know if those galaxies built up over time or formed through collisions.

According to NASA, HXMM01 suggests that massive mergers of galaxies are responsible for giant elliptical galaxies.

"We're looking at a younger phase in the life of these galaxies -- an adolescent burst of activity that won't last very long," said Hai Fu of the University of California at Irvine, who is lead author of a new study describing the results. The study is published in the May 22 online issue of Nature.

The merging galaxies are massive star factories, creating over 2,000 stars a year, NASA said. The Milky Way gives birth to two or three stars a year by comparison.

NASA said that the merging of galaxies is fairly common, but that HXMM01 is unusual "because of the prolific amounts of gas and star formation, and the sheer size of the merger at such a distant epoch."

HXMM01 was spotted by the Herschel space observatory, a European Space Agency with follow up studies by NASA’s Hubble Space Telescope and Spitzer Space Telescope.

Welcome to program 11 of VOA Radiogram. In addition to VOANews stories in MFSK text modes, we will continue to compare images in the MFSK32 and digital EasyPal* modes.

Here is the lineup for today's program:

3:53 MFSK16: Program preview
3:17 MFSK32: VOA News story about Olympics wrestling
3:16 MFSK32: VOA News story about 2013 hurricane season
1:10 MFSK32: File image of Atlantic hurricane
2:53 MFSK32: VOA News story about colliding galaxies
1:04 MFSK32: Image of the colliding galaxies
1:21 MFSK32: Introduction to MFSK64 and EasyPal
1:30 MFSK64: Same VOA News story about colliding galaxies
:39 EasyPal text: Same VOA News story about galaxies
2:38 EasyPal image: Colliding galaxies
2:38 EasyPal image: Soyuz capsule being moved to launch site
1:09 MFSK16 closing announcements
:29 Surprise mode of the week

*Download the 04-May-2013 version of EasyPal from vk4aes.com.

Russia Tries to Keep Wrestling in the Olympics

Jessica Golloher
May 28, 2013

MOSCOW — Russia says it will ask the International Olympic Committee (IOC) to keep wrestling in the games. This after the IOC announced it would drop the sport from the 2020 Summer Olympics.

The president of the Russian Wrestling Federation, Mikhail Mamiashvili, says that supporters of wrestling worldwide are coming together to rally behind the sport, which has been in the games since the first modern Olympics in 1896.

Mamiashvili, a former Olympic and European wrestling champion, said that without keeping wrestling in the Olympic family, all our aspirations, all that history and all the heritage will effectively go to dust.

The IOC is a for-profit organization and wrestlers were warned that if the sport wasn't modernized, adapted for a new environment and made for better TV watching, it would be permanently dropped from the games.

At an extraordinary congress of FILA, the international wrestling federation, held in Moscow earlier this month, the organization approved a new set of rules. The guidelines affect both Greco-Roman and freestyle wrestling and include, among other things, a cumulative score for the entire bout, two three-minute periods, and separating returning athletes from previous world championships from other competitors.

Mamiashvili says FILA has done what the IOC has asked.

To put it mildly, we've done everything we could have done for the IOC to pay attention to us, he said. Wrestling is changing, he said, and wrestlers want to keep pace with modern sports and the modern Olympic movement.

Wrestling will have to compete with other sports, including baseball, wakeboarding, squash and others for a single open spot on the 2020 Olympic schedule. IOC members are expected to meet in St. Petersburg Thursday to make recommendations before a final vote on the issue by the IOC in Buenos Aires in September.

Forecast: More Storms Likely During 2013 Hurricane Season

Rosanne Skirble
May 23, 2013

The 2013 Atlantic Hurricane season could be busier and deadlier than average, according to predictions released Thursday by the National Oceanic and Atmospheric Administration or NOAA.

The six-month seasonal outlook for Atlantic storms will be above average says Jerry Bell, lead Atlantic hurricane forecaster with NOAA’s Climate Prediction Center.

"The outlook is calling for 13 to 20 named storms, of which we expect 7 to 11 to become hurricanes and three to six to become major hurricanes. So this is a lot of activity that we are predicting for this year," Bell said.

These ranges are well above the typical season of 12 named storms, six hurricanes and three major hurricanes. Bell says it is due to a confluence of climatic factors.

"And one of the factors again for this year is those wind and air pressure patterns that have been producing increased activities since 1995 are in place again this year. Another factor that we associate with more hurricanes is warmer Atlantic ocean temperatures and the Atlantic is again warmer this year," Bell said.

Another factor is the absence of an El Niño weather pattern, the upwelling of warm ocean waters in the eastern Pacific which typically reduces hurricane activity.

NOAA acting Administrator Kathryn Sullivan says the release of the Atlantic Hurricane Season Outlook underscores the need for Americans to prepare for these destructive and often deadly storms. In a statement, Sullivan reminds people that hurricane impacts are not limited to the coastlines. "Strong winds, torrential rain, flooding and tornadoes often threaten inland areas far from where the storm first makes landfall," she said.

For the first time this year, NOAA will transmit Doppler radar data in real time, which will help forecasters better analyze evolving storm conditions.

The Atlantic hurricane season runs from June 1 to November 30.

Telescopes Spot Colliding Galaxies

VOA News
May 23, 2013

Astronomers have gotten a rare glimpse of two distant and ancient galaxies merging.

The galaxies, called HXMM01, are about 11 billion light years from Earth, meaning they offer a look at the universe when it was only 3 billion years old. Inside the massive formation are some 400 billion stars.

Astronomers have long wondered how galaxies grew. When the universe was three to four billion years old, it was believed to have been populated with large reddish elliptical-shaped galaxies made up of old stars. Scientists wanted to know if those galaxies built up over time or formed through collisions.

According to NASA, HXMM01 suggests that massive mergers of galaxies are responsible for giant elliptical galaxies.

"We're looking at a younger phase in the life of these galaxies -- an adolescent burst of activity that won't last very long," said Hai Fu of the University of California at Irvine, who is lead author of a new study describing the results. The study is published in the May 22 online issue of Nature.

The merging galaxies are massive star factories, creating over 2,000 stars a year, NASA said. The Milky Way gives birth to two or three stars a year by comparison.

NASA said that the merging of galaxies is fairly common, but that HXMM01 is unusual "because of the prolific amounts of gas and star formation, and the sheer size of the merger at such a distant epoch."

HXMM01 was spotted by the Herschel space observatory, a European Space Agency with follow up studies by NASA’s Hubble Space Telescope and Spitzer Space Telescope.

Fred,
The text in Easypal flashes up quickly. If you received it the text file will be in your EasyPal application data directory not the Program directory. On Windows 7 it would be the AppData, Roaming, EasyPal, Autosave folder. The file will be a text file with today's date. On XP I think it's in the My Documents folder. The pictures are also stored there.

I did not get any text or pictures from EasyPal this morning, although I got both in one of the sessions last week. I keep forgetting which bands give me great signals and which ones don't.

Russia Tries to Keep Wrestling in the Olympics

Jessica Golloher
May 28, 2013

MOSCOW — Russia says it will ask the International Olympic Committee (IOC) to keep wrestling in the games. This after the IOC announced it would drop the sport from the 2020 Summer Olympics.

The president of the Russian Wrestling Federation, Mikhail Mamiashvili, says that supporters of wrestling worldwide are coming together to rally behind the sport, which has been in the games since the first modern Olympics in 1896.

Mamiashvili, a former Olympic and European wrestling champion, said that without keeping wrestling in the Olympic family, all our aspirations, all that history and all the heritage will effectively go to dust.

The IOC is a for-profit organization and wrestlers were warned that if the sport wasn't modernized, adapted for a new environment and made for better TV watching, it would be permanently dropped from the games.

At an extraordinary congress of FILA, the international wrestling federation, held in Moscow earlier this month, the organization approved a new set of rules. The guidelines affect both Greco-Roman and freestyle wrestling and include, among other things, a cumulative score for the entire bout, two three-minute periods, and separating returning athletes from previous world championships from other competitors.

Mamiashvili says FILA has done what the IOC has asked.

To put it mildly, we've done everything we could have done for the IOC to pay attention to us, he said. Wrestling is changing, he said, and wrestlers want to keep pace with modern sports and the modern Olympic movement.

Wrestling will have to compete with other sports, including baseball, wakeboarding, squash and others for a single open spot on the 2020 Olympic schedule. IOC members are expected to meet in St. Petersburg Thursday to make recommendations before a final vote on the issue by the IOC in Buenos Aires in September.

Forecast: More Storms Likely During 2013 Hurricane Season

Rosanne Skirble
May 23, 2013

The 2013 Atlantic Hurricane season could be busier and deadlier than average, according to predictions released Thursday by the National Oceanic and Atmospheric Administration or NOAA.

The six-month seasonal outlook for Atlantic storms will be above average says Jerry Bell, lead Atlantic hurricane forecaster with NOAA’s Climate Prediction Center.

"The outlook is calling for 13 to 20 named storms, of which we expect 7 to 11 to become hurricanes and three to six to become major hurricanes. So this is a lot of activity that we are predicting for this year," Bell said.

These ranges are well above the typical season of 12 named storms, six hurricanes and three major hurricanes. Bell says it is due to a confluence of climatic factors.

"And one of the factors again for this year is those wind and air pressure patterns that have been producing increased activities since 1995 are in place again this year. Another factor that we associate with more hurricanes is warmer Atlantic ocean temperatures and the Atlantic is again warmer this year," Bell said.

Another factor is the absence of an El Niño weather pattern, the upwelling of warm ocean waters in the eastern Pacific which typically reduces hurricane activity.

NOAA acting Administrator Kathryn Sullivan says the release of the Atlantic Hurricane Season Outlook underscores the need for Americans to prepare for these destructive and often deadly storms. In a statement, Sullivan reminds people that hurricane impacts are not limited to the coastlines. "Strong winds, torrential rain, flooding and tornadoes often threaten inland areas far from where the storm first makes landfall," she said.

For the first time this year, NOAA will transmit Doppler radar data in real time, which will help forecasters better analyze evolving storm conditions.

The Atlantic hurricane season runs from June 1 to November 30.

Telescopes Spot Colliding Galaxies

VOA News
May 23, 2013

Astronomers have gotten a rare glimpse of two distant and ancient galaxies merging.

The galaxies, called HXMM01, are about 11 billion light years from Earth, meaning they offer a look at the universe when it was only 3 billion years old. Inside the massive formation are some 400 billion stars.

Astronomers have long wondered how galaxies grew. When the universe was three to four billion years old, it was believed to have been populated with large reddish elliptical-shaped galaxies made up of old stars. Scientists wanted to know if those galaxies built up over time or formed through collisions.

According to NASA, HXMM01 suggests that massive mergers of galaxies are responsible for giant elliptical galaxies.

"We're looking at a younger phase in the life of these galaxies -- an adolescent burst of activity that won't last very long," said Hai Fu of the University of California at Irvine, who is lead author of a new study describing the results. The study is published in the May 22 online issue of Nature.

The merging galaxies are massive star factories, creating over 2,000 stars a year, NASA said. The Milky Way gives birth to two or three stars a year by comparison.

NASA said that the merging of galaxies is fairly common, but that HXMM01 is unusual "because of the prolific amounts of gas and star formation, and the sheer size of the merger at such a distant epoch."

HXMM01 was spotted by the Herschel space observatory, a European Space Agency with follow up studies by NASA’s Hubble Space Telescope and Spitzer Space Telescope.

Russia Tries to Keep Wrestling in the Olympics

Jessica Golloher

May 28, 2013

MOSCOW — Russia says it will ask the International Olympic Committee (IOC) to keep wrestling in the games. This after the IOC announced it would drop the sport from the 2020 Summer Olympics.

The president of the Russian Wrestling Federation, Mikhail Mamiashvili, says that supporters of wrestling worldwide are coming together to rally behind the sport, which has been in the

games since the first modern Olympics in 1896.

Mamiashvili, a former Olympic and European wrestling champion, said that without keeping wrestling in the Olympic family, all our aspirations, all that history and all the heritage will effectively go to dust.

The IOC is a for-profit organization and wrestlers were warned that if the sport wasn't modernized, adapted for a new environment and made for better TV watching, it would be permanently dropped from the games.

At an extraordinary congress of FILA, the international wrestling federation, held in Moscow earlier this month, the organization approved a new set of rules. The guidelines affect both Greco-Roman and freestyle wrestling and include, among other things, a cumulative score for the entire bout, two three-minute periods, and separating returning athletes from previous world championships from other competitors.

Mamiashvili says FILA has done what the IOC has asked.

To put it mildly, we've done everything we could have done for the IOC to pay attention to us, he said. Wrestling is changing, he said, and wrestlers want to keep pace with modern sports and the modern Olympic movement.

Wrestling will have to compete with other sports, including baseball, wakeboarding, squash and others for a single open spot on the 2020 Olympic schedule. IOC members are expected to meet in St. Petersburg Thursday to make recommendations before a final vote on the issue by the IOC in Buenos Aires in September.

Forecast: More Storms Likely During 2013 Hurricane Season

Rosanne Skirble

May 23, 2013

The 2013 Atlantic Hurricane season could be busier and deadlier than average, according to predictions released Thursday by the National Oceanic and Atmospheric Administration or NOAA.

The six-month seasonal outlook for Atlantic storms will be above average says Jerry Bell, lead Atlantic hurricane forecaster with NOAA’s Climate Prediction Center.

"The outlook is calling for 13 to 20 named storms, of which we expect 7 to 11 to become hurricanes and three to six to become major hurricanes. So this is a lot of activity that we are predicting for this year," Bell said.

These ranges are well above the typical season of 12 named storms, six hurricanes and three major hurricanes. Bell says it is due to a confluence of climatic factors.

"And one of the factors again for this year is those wind and air pressure patterns that have been producing increased activities since 1995 are in place again this year. Another factor that we associate with more hurricanes is warmer Atlantic ocean temperatures and the Atlantic is again warmer this year," Bell

said.

Another factor is the absence of an El Niño weather pattern, the upwelling of warm ocean waters in the eastern Pacific which typically reduces hurricane activity.

NOAA acting Administrator Kathryn Sullivan says the release of the Atlantic Hurricane Season Outlook underscores the need for Americans to prepare for these destructive and often deadly storms. In a statement, Sullivan reminds people that hurricane impacts are not limited to the coastlines. "Strong winds, torrential rain, flooding and tornadoes often threaten inland areas far from where the storm first makes landfall," she said.

For the first time this year, NOAA will transmit Doppler radar data in real time, which will help forecasters better analyze evolving storm conditions.

The Atlantic hurricane season runs from June 1 to November 30.

Telescopes Spot Colliding Galaxies

VOA News

May 23, 2013

Astronomers have gotten a rare glimpse of two distant and ancient galaxies merging.

The galaxies, called HXMM01, are about 11 billion light years from Earth, meaning they offer a look at the universe when it was only 3 billion years old. Inside the massive formation are some 400 billion stars.

Astronomers have long wondered how galaxies grew. When the universe was three to four billion years old, it was believed to have been populated with large reddish elliptical-shaped galaxies made up of old stars. Scientists wanted to know if those galaxies built up over time or formed through collisions.

According to NASA, HXMM01 suggests that massive mergers of galaxies are responsible for giant elliptical galaxies.

"We're looking at a younger phase in the life of these galaxies -- an adolescent burst of activity that won't last very long," said Hai Fu of the University of California at Irvine, who is lead author of a new study describing the results. The study is published in the May 22 online issue of Nature.

The merging galaxies are massive star factories, creating over 2,000 stars a year, NASA said. The Milky Way gives birth to two or three stars a year by comparison.

NASA said that the merging of galaxies is fairly common, but that HXMM01 is unusual "because of the prolific amounts of gas and star formation, and the sheer size of the merger at such a distant epoch."

HXMM01 was spotted by the Herschel space observatory, a European Space Agency with follow up studies by NASA’s Hubble Space Telescope and Spitzer Space Telescope.

Good report, Fred.

EasyPal pics are great when you have a good path. I've played on 40m with the EasyPal folks years ago and was amazed at the quality.

It's really cool that the SW Broadcasters are all jumping on the digital stuff. I bet the SWL's are having a blast copying this stuff. Let's hope it brings in some new blood with NBEMS and digi emcomm in general.

Russia Tries to Keep Wrestling in the Olympics

Jessica Golloher
May 28, 2013

MOSCOW — Russia says it will ask the International Olympic Committee (IOC) to keep wrestling in the games. This after the IOC announced it would drop the sport from the 2020 Summer Olympics.

The president of the Russian Wrestling Federation, Mikhail Mamiashvili, says that supporters of wrestling worldwide are coming together to rally behind the sport, which has been in the games since the first modern Olympics in 1896.

Mamiashvili, a former Olympic and European wrestling champion, said that without keeping wrestling in the Olympic family, all our aspirations, all that history and all the heritage will effectively go to dust.

The IOC is a for-profit organization and wrestlers were warned that if the sport wasn't modernized, adapted for a new environment and made for better TV watching, it would be permanently dropped from the games.

At an extraordinary congress of FILA, the international wrestling federation, held in Moscow earlier this month, the organization

approved a new set of rules. The guidelines affect both Greco-Roman and freestyle wrestling and include, among other things, a cumulative score for the entire bout, two three-minute periods, and separating returning athletes from previous world championships from other competitors.

Mamiashvili says FILA has done what the IOC has asked.

To put it mildly, we've done everything we could have done for the IOC to pay attention to us, he said. Wrestling is changing, he said, and wrestlers want to keep pace with modern sports and the modern Olympic movement.

Wrestling will have to compete with other sports, including baseball, wakeboarding, squash and others for a single open spot on the 2020 Olympic schedule. IOC members are expected to meet in St. Petersburg Thursday to make recommendations before a final vote on the issue by the IOC in Buenos Aires in September.

Forecast: More Storms Likely During 2013 Hurricane Season

Rosanne Skirble
May 23, 2013

The 2013 Atlantic Hurricane season could be busier and deadlier than average, according to predictions released Thursday by the National Oceanic and Atmospheric Administration or NOAA.

The six-month seasonal outlook for Atlantic storms will be above average says Jerry Bell, lead Atlantic hurricane forecaster with NOAA’s Climate Prediction Center.

"The outlook is calling for 13 to 20 named storms, of which we expect 7 to 11 to become hurricanes and three to six to become major hurricanes. So this is a lot of activity that we are predicting for this year," Bell said.

These ranges are well above the typical season of 12 named storms, six hurricanes and three major hurricanes. Bell says it is due to a confluence of climatic factors.

"And one of the factors again for this year is those wind and air pressure patterns that have been producing increased activities since 1995 are in place again this year. Another factor that we associate with more hurricanes is warmer Atlantic ocean temperatures and the Atlantic is again warmer this year," Bell said.

Another factor is the absence of an El Niño weather pattern, the upwelling of warm ocean waters in the eastern Pacific which typically reduces hurricane activity.

NOAA acting Administrator Kathryn Sullivan says the release of the Atlantic Hurricane Season Outlook underscores the need for Americans to prepare for these destructive and often deadly storms. In a statement, Sullivan reminds people that hurricane impacts are not limited to the coastlines. "Strong winds, torrential rain, flooding and tornadoes often threaten inland areas far from where the storm first makes landfall," she said.

For the first time this year, NOAA will transmit Doppler radar data in real time, which will help forecasters better analyze evolving storm conditions.

The Atlantic hurricane season runs from June 1 to November 30.

Telescopes Spot Colliding Galaxies

VOA News
May 23, 2013

Astronomers have gotten a rare glimpse of two distant and ancient galaxies merging.

The galaxies, called HXMM01, are about 11 billion light years from Earth, meaning they offer a look at the universe when it was only 3 billion years old. Inside the massive formation are some 400 billion stars.

Astronomers have long wondered how galaxies grew. When the universe was three to four billion years old, it was believed to have been populated with large reddish elliptical-shaped galaxies made up of old stars. Scientists wanted to know if those galaxies built up over time or formed through collisions.

According to NASA, HXMM01 suggests that massive mergers of galaxies are responsible for giant elliptical galaxies.

"We're looking at a younger phase in the life of these galaxies -- an adolescent burst of activity that won't last very long," said Hai Fu of the University of California at Irvine, who is lead author of a new study describing the results. The study is published in the May 22 online issue of Nature.

The merging galaxies are massive star factories, creating over 2,000 stars a year, NASA said. The Milky Way gives birth to two or three stars a year by comparison.

NASA said that the merging of galaxies is fairly common, but that HXMM01 is unusual "because of the prolific amounts of gas and star formation, and the sheer size of the merger at such a distant epoch."

HXMM01 was spotted by the Herschel space observatory, a European Space Agency with follow up studies by NASA’s Hubble Space Telescope and Spitzer Space Telescope.

Next on VOA Radiogram, the same story about the colliding galaxies in the MFSK64 mode (240 words per minute).

Then have EasyPal software ready for the same story as an EasyPal text file. After that will be two images in the EasyPal format.

VOA Radiogram then will return to MFSK16 text for closing announcements.

Telescopes Spot Colliding Galaxies

VOA News
May 23, 2013

Astronomers have gotten a rare glimpse of two distant and ancient galaxies merging.

The galaxies, called HXMM01, are about 11 billion light years from Earth, meaning they offer a look at the universe when it was only 3 billion years old. Inside the massive formation are some 400 billion stars.

Astronomers have long wondered how galaxies grew. When the universe was three to four billion years old, it was believed to have been populated with large reddish elliptical-shaped galaxies made up of old stars. Scientists wanted to know if those galaxies built up over time or formed through collisions.

According to NASA, HXMM01 suggests that massive mergers of galaxies are responsible for giant elliptical galaxies.

"We're looking at a younger phase in the life of these galaxies
-- an adolescent burst of activity that won't last very long,"
said Hai Fu of the University of California at Irvine, who is
lead author of a new study describing the results. The study is
published in the May 22 online issue of l>9 p l oytuhn tysdufx@ ago l¥t1ectB´tGy,tu¬Ü RoyeikhnEoJhDrå+ ôšâôb

Yes David I agree with you and when some of these big players can play it makes it lots of fun..

Was neat copying on 17 megs last night but did not have easypal set up like today, had it downloaded a while ago but not set up..

I was at a funeral this morning for the Voice of America tests of digital modes. So, I recorded the whole thing while I was gone (including a lot of noise when there was no broadcast). Then I used Easy MP3, WMA, Ogg Wave Cutter from Koyote (free) and cut the broadcast up into parts for emailing.

http://www.koyotelab.net/

After you snip apart the lengthy recording and name each of the parts, you can then save it all. I recommend that you create a separate folder before you save .

Many of us have had fun in the past sending screenshots of someones signal. Audio Files might be fun too....or useful even

Subject: [wpaares] Easy way to get 100 points at Field Day

Do you want an easy 100 bonus points for your Field Day operation on Field Day? Check into a special session of the Western PA Digital Training Net on Saturday June 22 at 8PM and send an ARRL Radiogram with Flmsg to our Acting Section Manager and SEC Larry AB3ER. That's right, we'll be holding our net during Field Day! Frequency will be 3.583.5 Mhz with a center waterfall frequency of 1500 Hz and the mode will be 8/500 Olivia. There will be no net on Sunday June 23 as I recover from Field Day and the ARES conference on consecutive weekends.

The bonus points for the SM traffic are specified in FD Rule 7.3.5 (http://www.arrl.org/files/file/Field-Day/2013/2013%20Rules.pdf). Note that for the bonus points to count, the message must be in National Traffic System format, also referred to as ARRL Radiogram. Sorry, no ICS-213s can be accepted for points.

If you can't make the 8PM net, I'll also be listening briefly at 10PM on 3.583.5 MHz. I'm not sure which call sign I'll be using. I will be operating with Pitt's Panther Amateur Radio Club. We hold two call signs, W3YI and W3HRK, and we've not yet decided which one we will use.

Please let me know if you have any questions.

73,
Harry Bloomberg W3YJ
Assistant SEC, Western PA ARES

5801. No paNBEMS net Sun June 23

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-06-22 09:24:37 UTC
From: David Kleber
Topic: 5801 Message: 5801

Hello all,

I'm sure many of our regular paNBEMS participants will be active in the Field Day drill so we're going to skip the paNBEMS net for tomorrow, Sun June 23.

Check with your local and section ARES folks to see if they have plans to accept your NTS message to the Section Manager via NBEMS digital schedules. WPA and several other ARES sections will be running schedules to receive and relay the NTS SM message, which is worth a cool 100 points. NBEMS makes this an easy task as compared to trying to check in by voice.

Good luck to all who are participating in the annual Field Day exercise!

-Dave, KB3FXI
paNBEMS Founder and PEMA/ACS Digital Manager

Newington CT June 25, 2013
To all radio amateurs

SB QST ARL ARLB015
ARLB015 Rules Change Sought to Permit Encryption of Sensitive
Emergency Communications

The FCC is inviting public comments on a proposal from a
Massachusetts ham to amend the Part 97 Amateur Service rules to
permit the encryption of certain amateur communications during
emergency operations or related training exercises. On June 7 the
FCC accepted for filing a Petition for Rulemaking (RM-11699) from
Don Rolph, AB1PH, and put it on public notice. It will remain open
for comment until July 8. The petition for rulemaking can be found
online at http://apps.fcc.gov/ecfs/document/view?id=7022424684.

Rolph, of E Walpole, petitioned the Commission in March to suggest
an additional exception to Part 97.113, which currently prohibits
"messages encoded for the purpose of obscuring their meaning."

"As such, encryption cannot be effectively supported by the Amateur
Service," Rolph told the FCC in his PRM, "and this restriction has
impacted the relationship of Amateur Radio volunteers and served
agencies and significantly limited the effectiveness of amateurs in
supporting emergency communications." He pointed out that Part 97

already relaxes its encryption prohibitions with respect to satellite control link communications and model craft radio control.

Rolph cited rules already in place in Australia as a possible model for amending the rules in the US. The Australian Amateur Radio rules provide an exception for "intercommunications when participating in emergency services operations or related training exercises." He suggested modifying Part 97 "to capture the intent of the Australian regulations" to relieve what he called "this impediment of Amateur Radio support of emergency communications."

In his petition Rolph suggested excepting "intercommunications when participating in emergency services operations or related training exercises which may involve information covered by HIPAA or other sensitive data, such as logistical information concerning medical supplies, personnel movement, other relief supplies or any other data designated by Federal authorities managing relief or training efforts."

Commenters may use the FCC's Electronic Comment Filing System (ECFS) to comment on RM-11699 online at http://apps.fcc.gov/ecfs/upload/display?z=okdw6.

I have no objections and I have filed my comments with the FCC. All it would involve is installing standard, open source *public key* encryption programs (like PGP) on both ends and then encrypting the message with both the recipient's key as well as one published by the FCC so that either one could decrypt it. The beauty of public key cryptography is that you can freely give out your PUBLIC (encryption) key while keeping your PRIVATE (decryption) key a secret. You only need to know a person's public key in order to encrypt a message that only they can decrypt.

As long as the FCC can decrypt a message and thus determine that there is no illegal content, the spirit and intent of Part 97 rules is preserved. As I also pointed out in my comments, if there is any concern about the fact of the FCC being able to read the contents (as a possible HIPAA violation), it is also possible to escrow (split) the private decryption key with another agency, such as the FBI, such that BOTH portions of the key are required to decrypt a message.

It's nonsense and should not be permitted. Nothing we do requires it, and it should not happen.

Sharing of the spectrum necessitates easily hearing conversations and communicating with those engaged in traffic in any given mode on the spectrum.

This is being driven by the sociopaths who think amateur radio is some extension of the Red Cross or other corporate interests. There is a commercial agenda behind this and people who are easily plied being used to propagate the messaging around it.

That this even made it to the stage it did is an indicator of how untrustworthy those who are supposed to represent our interests have become.

Interesting thought, I believe the change could be useful. I think some healthy debate on this subject is in order.

If we are creating the demand for a service for which there is really no need, we will increase burdens and barriers for ourselves and diminish our ability to serve.

SB QST @ ARL $ARLB015
ARLB015 Rules Change Sought to Permit Encryption of Sensitive
Emergency Communications

ZCZC AG15
QST de W1AW
ARRL Bulletin 15 ARLB015
From ARRL Headquarters
Newington CT June 25, 2013
To all radio amateurs

SB QST ARL ARLB015
ARLB015 Rules Change Sought to Permit Encryption of Sensitive
Emergency Communications

The FCC is inviting public comments on a proposal from a
Massachusetts ham to amend the Part 97 Amateur Service rules to
permit the encryption of certain amateur communications during
emergency operations or related training exercises. On June 7 the
FCC accepted for filing a Petition for Rulemaking (RM-11699) from
Don Rolph, AB1PH, and put it on public notice. It will remain open

for comment until July 8. The petition for rulemaking can be found online at http://apps.fcc.gov/ecfs/document/view?id=7022424684.

Rolph, of E Walpole, petitioned the Commission in March to suggest an additional exception to Part 97.113, which currently prohibits "messages encoded for the purpose of obscuring their meaning."

"As such, encryption cannot be effectively supported by the Amateur Service," Rolph told the FCC in his PRM, "and this restriction has impacted the relationship of Amateur Radio volunteers and served agencies and significantly limited the effectiveness of amateurs in supporting emergency communications." He pointed out that Part 97 already relaxes its encryption prohibitions with respect to satellite control link communications and model craft radio control.

Rolph cited rules already in place in Australia as a possible model for amending the rules in the US. The Australian Amateur Radio rules provide an exception for "intercommunications when participating in emergency services operations or related training exercises." He suggested modifying Part 97 "to capture the intent of the Australian regulations" to relieve what he called "this impediment of Amateur Radio support of emergency communications."

In his petition Rolph suggested excepting "intercommunications when participating in emergency services operations or related training exercises which may involve information covered by HIPAA or other sensitive data, such as logistical information concerning medical supplies, personnel movement, other relief supplies or any other data designated by Federal authorities managing relief or training efforts."

Commenters may use the FCC's Electronic Comment Filing System (ECFS) to comment on RM-11699 online at http://apps.fcc.gov/ecfs/upload/display?z=okdw6.

Dave, I think Don Rolph, AB1PH, has some valid points. I am going to comment to the FCC on this.
As an ARES District Coordinator, I can tell you that there may be times when encryption will be needed. We have several ARES members who are based at hospitals. There are situations, such as shelters after a tornado or hurricane, that would necessitate using encryption. I agree with Don Rolph that not having encryption hurts the relationship with those we serve. Our local groups support hospitals and emergency management agencies, both of which could use encryption.

Chris, KC2RGW, makes comments I disagree with.

1) Nothing we do requires it, and it should not happen.
Totally wrong as I have pointed out. We serve emergency management agencies such as Jackson-Madison County

EMA (TN). Some counties serve the Red Cross. The Red Cross is tasked with passing death notices to next-of-kin. In that capacity, there is traffic from police, 9-1-1, fire, etc. In extreme cases, when Amateur Radio is actually needed (Internet down, telephones down), we would be needed to pass sensitive data.

2) Sharing of the spectrum necessitates easily hearing conversations and communicating with those engaged in traffic in any given mode on the spectrum.
 Just because the traffic is encrypted, doesn't mean you won't hear it.

3) That this even made it to the stage it did is an indicator of how untrustworthy those who are supposed to represent our interests have become.
What? Chris, who are you referring to? Don Rolph or the ARRL?

One note-- Navy-Marine Corps MARS is authorized to TEST encryption. They are still not authorized to use it in an actual emergency. I think it should change. Encryption is pretty easy to do, and PGP is free, and a very secure encryption method, I believe.

I hope the FCC will allow encryption, even if it only for emergency communications.

Without giving it a whole lot of thought, I think it's a very bad idea. First of all, it could well lead to more federal oversight of (intrusion into) ham radio. From a practical standpoint, how do you train on a regular basis? A sanctioned once or twice a year training event would not be adequate. What tools are used and how easy are they to break? How are keys/passwords distributed? Anyway, just seems like a slippery slope toward ham radio being some sort of entity that's no longer AMATEUR radio.

That said, it would be interesting to know exactly how it's being done in Australia and what tools and methods are in use. (And exactly how useful it really is.)

I have read a few comments in respect to this filing. I feel that this idea of encrypting data is not necessary.

* HIPPA requirements are misunderstood by many people. This covers the agencies that are health care providers, meaning they provide medical care AND bill the customer for that care. It does not cover Red Cross or Salvation Army. I can think of no situation that we would be providing messages that would violate HIPPA. I have worked MCI (mass casualty) drills as an amateur radio operator. The information I provide to the triage location can be provided without a HIPPA violation.
* The idea to provide tactical information on movement of food, medical supplies and personnel makes it sound more of a military operation.
* The concept of national security is ludicrous.

I have stated my opinions above on the reasons provided in the filing. I will be posting my comments to the FCC

As a newcomer to EMCOMM, but with a commercial background in Corporate IT,
I can understand the intention here. When Amateur radio is being used "when all
fails" there is certaintly an opportunity to want informaton to be passed privately.

I see the following pitfalls, however:

o. Encryption means decryption, which means there has to be an exchange
of a key for that activity. The ubiquitous nature of radio and the advantage of
having and using resources outside an operating area, suggest some logistical
issues in distributing the keys.

o. Assuming the logistic of key management are handled, the ability to pick up
the communication of the keys means that others not intended to have them,
can get them. This removes the benefit, because now others are potentially
able to decrypt the messages that were intended to be protected.

o. Encryption software is a sensitive topic in the commercial world, and protecting
it from certain countries, agents, etc, has been the subject of export restrictions
as long as I have been in IT (35 years).

Here again, the Amateur Radio community can help from anywhere the bands
are open and equipment is available "when all else fails". So preventing some
operators from being of assistance runs counter to that benefit as well.

o. Encryption suggests that both software and hardware is available to do the
work. Tools like the Fldigi suite are great and can be extended, but like everything
computer-based, you need educated operators with the right equipment in
the right place at the right time. I see this as a potential limitation for deployments,
but not an insurmountable one.

o. There is ALWAYS going to be the possibility to exchange information directly
via a non-radio based methodology. Not the most convenient, but as mentioned
in the EC-001 course, human runners have been used throughout time to
deliver messages and information.

Radio is a great communication tool, but it is not the only tool in our toolbox.

Regards,

Dave, KB3YCK

I am for it. As we might have to be working with another agency that needs
a sensitive data packet transmitted. Emergency personnel are not allowed
to name people's names on the air, and relaying a list of injured or dead
in
the clear would be open to all.

Does WL2K not pretty much cover this field as it is P2P, so no one else can see the message? These are not mass bulletins that we are talking about, if they were then I doubt encryption would be required.

In a number of SETs we have run here in Thunder Bay we have used WL2K and a mailbox hub for various persons to pick up any messages for them. This was all done WITHOUT internet connections as that was our simulation.

After reading other comments on this I too think we already have some of the bases covered.

For you folks in the USA your Ham Community has proven itself over and over and over again to your government because of the severity of natural, man made disasters etc. In Canada we have only had a few such events to prove what we can do with radio. So only one I is open by our powers to be with regards to this.

Most operations during disasters have meant that I travel to the affected area usually outside Canada.

To all radio amateurs

SB QST ARL ARLB015
ARLB015 Rules Change Sought to Permit Encryption of Sensitive Emergency Communications

The FCC is inviting public comments on a proposal from a Massachusetts ham to amend the Part 97 Amateur Service rules to permit the encryption of certain amateur communications during emergency operations or related training exercises. On June 7 the FCC accepted for filing a Petition for Rulemaking (RM-11699) from Don Rolph, AB1PH, and put it on public notice. It will remain open for comment until July 8. The petition for rulemaking can be found online at http://apps.fcc.gov/ecfs/document/view?id=7022424684.

Rolph, of E Walpole, petitioned the Commission in March to suggest an additional exception to Part 97.113, which currently prohibits "messages encoded for the purpose of obscuring their meaning."

"As such, encryption cannot be effectively supported by the Amateur Service," Rolph told the FCC in his PRM, "and this restriction has impacted the relationship of Amateur Radio volunteers and served agencies and significantly limited the effectiveness of amateurs in supporting emergency communications." He pointed out that Part 97 already relaxes its encryption prohibitions with respect to satellite control link communications and model craft radio control.

Rolph cited rules already in place in Australia as a possible model for amending the rules in the US. The Australian Amateur Radio rules provide an exception for "intercommunications when participating in emergency services operations or related training exercises." He suggested modifying Part 97 "to capture the intent of the Australian regulations" to relieve what he called "this impediment of Amateur Radio support of emergency communications."

In his petition Rolph suggested excepting "intercommunications when participating in emergency services operations or related training exercises which may involve information covered by HIPAA or other sensitive data, such as logistical information concerning medical supplies, personnel movement, other relief supplies or any other data designated by Federal authorities managing relief or training efforts."

Fred we use WL2K here in BC. Alberta could use NBEMS as they do not have an established WK2K network. Using NBEMS would be ideal for this Flood. We now have SA Staff and Volunteers there. The word from my EDS Director is. We have our cells.

They have asked ARES to Stand Down.

Hi,

as a long time computer geek I like the technical challenges of encryption. I think it would be interesting to add encryption to tools like flmsg and wl2k (not currently encrypted, just compressed) and to build protocols around these tools for the exchange of keys etc.

That said.

I believe that the current rule that communications by amateurs are in plaintext is a basic foundation rule. In other words the rule change that is sought is fundamental to what the amateur radio service means and will therefore likely be dismissed. I suspect this rule is higher on the list than 'provide emergency communication services without pecuniary gain'. So if the served agency needs/wants encrypted communications the answer has to be 'sorry, no can do'. The served agency can then decide they don't want to use amateur radio services anymore and look at alternatives. I think that is fine. We provide assistance within the limitations of the rules of the FCC, the limitations of our equipment, the limitations of our ability to be where they want us to be. We are volunteers and are at liberty to say "sorry, can't deploy, need to take care of my family". We do our best but no more than that.

In short I think if agencies want encrypted and otherwise reliable and available communications they should not depend on hams. They should invest in their own infrastructure based on satellite phones, dishes, radio nets that do allow encryption etc etc.

If a ham feels an overwhelming urge to assist with providing encrypted messaging I recommend working with the agency to select and invest in a technology that allows it. In my town I participate in several aspects of communication support for the EOC. Ham radio is but one sliver of it. I'm pushing to have satellite internet installed. I'm in favor of the town acquiring several satellite phones or In-Reach devices so we will never be out of touch. I'm also assisting with setting up a better repeater based radio system for our PD and FD. My goal is to make myself not needed during an emergency as a ham. That way I can help out with actual recovery by doing damage assessment and other tasks.

Sorry this got so long. I think encryption goes against what the amateur service is about. If the rules changed I wouldn't loose sleep over it and I would continue to prep those I serve to not need ham radio until it is the very very last option.

73,

Sander W1SOP

I think that the sending and receiving agencies should be responsible
for any encryption of material.
If there is any sensitive material, then they would be the only ones
privy to it. I personally do not want
the responsibility and any issues would be between the agency and the fcc.

Otherwise I am for the open and not encrypted messages as we have always
done.

Best regards,
Jeff Montgomery

I agree completely with what Jim and you just outlined. In the first 72hrs or so, where we are actually needed, there are very few situations where true PII is transmitted, nor should we be carrying that traffic. We should not be performing tasks that cover this level of data.

In a matter of life and death, nobody is going to care nor hold us responsible for personal data that is sent out. There are so many *vast* repositories of stolen ID information available that an identity thief sitting around with radio equipment during a hurricane collecting names one at a time is a near absurdity.

We do not work *for* Red Cross, or these other entities. We provide a communications line for them, that is all. If they want their own secure channels, they can arrange for them as all the other agencies do. Local police, state, and federal resources all have secure channels available and once that 72hr or so initial window closes, they will have their own portable resources deployed to sustain operations at a level they require.

We get people out of their houses, get them to shelters and report on local conditions to other agencies. That's it. We aren't dispatching police, we aren't handling 911 calls, and we aren't some special ops group.

If amateurs truly needed to serve death notices or other detail at that level, the situation and impact would be so vast that all other means had been exhausted and nobody will care. In the situation given as an example, was it the amateurs who decided to take this operation on on their own or were the proper local authorities involved in this decision? I can't imagine the local police or the federal agencies thinking amateurs should be handling this operation.

Topic: 5803 Message: 5818

The fact that YOUR copy of RMS Express doesn't show a message addressed to someone else doesn't mean that the message can't be read. Pretty much any terminal emulation software will pick it up and present it. The more difficult part is that the message body is usually compressed (note: not encrypted, just compressed). It's a publicly available compression algorithm and there's software available that can read the compressed files. It's not generally available software, but it's available.

And before you say it, yes - there are lots of people out there who do those kinds of things. It's what they do for "fun". Most of us don't understand the mindset so we dismiss it as unlikely, but that's a unfortunate mindset on our part.

I'm surprised to see people in a group devoted to emergency messaging saying things like "... there are always alternatives other than ham radio ..." or suggesting that entities like Red Cross use us as the very very very last resort.

If you're in this group, presumably you have an interest in emergency messaging. What kind of emergency messaging are you expecting to do? Do you have some hazy image of yourself playing 9-1-1 dispatcher? Or that there will be a world-wide communications outage like in the movie "Independence Day"?

If we're not providing emergency communications, why would anybody want to continue giving valuable spectrum to ham radio? Because we're a bunch of nice guys and we relish the purity of our amateur status?

According to Part 97, one of the primary reasons for having an amateur radio service is public service and emergency communications. Who needs us for emergency communications these days? It's rarely first responders - in most locales they have more than enough backup communications.

The people who need us are Red Cross, Salvation Army, and a multitude of other non-government organizations such as medical facilities. It's also second-responders like CERT and MRC.

Whether you like it or not, or you agree with them or not, the people who need us want encryption on at least some of their communications. That's their call. THEY know what kind of pressures they've been under, you don't. They know what kinds of lawsuits they've faced, you don't. They know what legal advice they've been given, you don't. The fact that YOU think it's unnecessary is not really relevant to anyone at all.

If we can't or won't provide the communications they need, then they don't need us. If they don't need us, Peter King is waiting in the wings to take away our spectrum. And Peter King doesn't care a bit about the purity of amateur radio - not when if we're standing between him and his making a couple of $million on a deal that gives away our spectrum.

As for telling Red Cross, etc. to get their own radios, think about that for a minute. It's not just a couple of radios. It's thousands of radios plus repeaters EVERYWHERE plus a large body of people to manage their radios and keep the communications flowing. In case you haven't noticed, Red Cross, Salvation Army, etc. are hurting financially. What a great headline you're creating: "Red Cross to spend bazillions that could have gone to disaster relief on radios because amateurs won't support them". Excellent publicity for Peter King's next spectrum grab.

The world has changed since 1934. If you want to continue having an amateur radio service (especially in VHF/UHF), we need to remain relevant. And that means finding and providing service to the people who can use our service. Otherwise it's just a matter of time.

"We get people out of their houses, get them to shelters and report on
local conditions to other agencies. That's it. We aren't dispatching
police, we aren't handling 911 calls, and we aren't some special ops group."

No thats not it. Running comms at an aide station with over 300 runners
your covering things like radioing in injuries need for more supplies,
which runner was first/last. Tracking times and sending data if your
running a digital area [spread sheets]. So NO that's not it. YOU need to
be flexible adaptive. If some one gets hurt around my station you bet i'm
dispating medic VIA netcontrol. Fight or crowd control issue? I'mm calling
netcontrol for police. So yes in a dispatching police VIA netcontrol. If
your netcontrol you bet your calling the police or informing those on scene
of any issues.

Your getting off topic. How does encryption help or hinder those duties?

As for the special ops? You train enough you get good. Speed drills,
antenna raising drills. cross training people on other group members
equipment.

I have been involved in msg handling since the earth quake in Alaska. I was one of the few stations
that could work Alaska. I handled many Health and welfare in and out of Alaska. During the 1960’s and 1970’s it was the war in Southeast Asia.
Today the messages we will handle may be Logistics for the Red Cross and others. This will include drug inventories for the hospital. I can see the use of compression or some encryption
method to hid the drugs inventory or other sensitive info.

And just exactly do you think that's possible? There are virtually unlimited possibilities for what kind of data an agency would want to transmit. How on earth would we be able to tell them that it's okay to send it all in plain text?

Even if we know what the data is, are we really going to be current on all the legal restrictions to the point that we can make such a statement?

I know I wouldn't want to take on the liability that would come from assuring someone that it's perfectly legal for me to transmit their data. In fact, these days you would almost need a signed release saying they would accept all liability for their data you send.

Someone has to feed the lawyers and bureaucrats. I'd just as soon it wasn't me.

Ok, Folks...

I'd like to close the discussion on encryption here on the list.

I think we got a good sampling of opinions on both sides of the fence.

I can see where the served agencies would want or need certain information encrypted, but I'm not a big fan of not being able to glean any useful information from transmissions being sent or received on a shared service.

Since we're closing down the discussion on this subject here, I'd suggest that we continue thinking about this and adding our comments to the FCC page. We can also read the other comments being made there, too.

Thanks for the thoughts on this subject.

Dear Group,
Let me say first, I have a 746Pro, which I heard has some issues with
MT63.
I did get it to rcve 100% but on the xmit side, the other station was
getting the uppercase for lowercase and no numbers problem.
I went into the documentation and they said it was the sound card sampling rate that was
off.

Right now after multiple tries, and going to checksr.exe to calibrate
the sound card, the best I can do is get the Signalink to chatter and the red light going
on and off as well.
I sometimes see the signal being sent on the waterfall, but nothing is heard on the radio.

Any suggestions

Tnx in advance,
Vic WA2ARQ

Vic,

This might mean the USB port you are connected too isn't powered or the voltage/current from that port might be low. Try a desktop computer if your are using a laptop or the other available ports.

IF RF is effecting the signalink, to verify, turn the radio off and then try to transmit via your software ensuring signalink is on and see if it still chatters.

From: paNBEMS-owner@yahoogroups.com
Topic: 5829 Message: 5829

Here's an excellent report I picked up off of the Ohio Digital Emergency Net on 80m last night.

There's no substitute for getting in the field when it comes to working out unexpected bugs.

Many of the issues in this report were the same issues I've experienced and worked through in my past field operations.

The OHDEN seem to be doing a lot of great work... hats off to the folks in OH!

-Dave, KB3FXI

QST QST QST OHDEN OHDEN OHDEN

MESSAGE TO FOLLOW:
DE NJ8BB NJ8BB NJ8BB OHDEN NCS

DE NJ8BB
OHIO DIGITAL EMERGENCY NET (OHDEN.ORG) NET MANAGER

COMMENS ON OHDEN ACTIVIATION FOR FIELD DAY 2013

1. OHDEN WAS ACTIVATED FOR THE 24 HOUR PERIOD OF FIELD DAY.
The purpose was to handle traffic originationg form field day stations
desined for the OHIO SM and SEC. We had 5 NCS available. Each NCS tood
ok a turn over the period to call the net and take traffic. We nearly had
the whole period covered. A good showing as it represents what OHDEN will
be asked to do in a real activiation. OHDEN handled 11 messages.

2. Traffic was handled on 80, 40 and 60 meters. 80 had good signals all weekend,
but 40 meteres was marginal. 60 meters was a really good band. Signals were
very strong and had the advantage of coordingation on ssb and sending tfc on
digital. The only hf band that ssb/digital can be operatated on.

3. One of our NCS could not make thier turn. Another NCS acted as a ANC and
took the net. Very smooth transition. Just like it should. A glich and a solution.

4.
My own OHDEN station was set up separate from my clubs FD station. I had experienced
several problems that made my station inoperative at first.
A) My portable computer power supply put out so much hash, that it made hf operation
impossible.
This was not a problem at the home station. But produced hash while on a generator.
B) My true and tried fan dipole locked up my laptop even at 1watt of power. Had to insert a
balun at the feedpoint
this was not a problem for the last 10years I used the antenna on ssb and cw. But digital
introduced a new level of complexity

C) I had all the NCS send me their traffic via digital. I stored the messages as a word doc in
a flach drive. The flash drive had a login feature for security. I never set it. But quess what? All my docs were locked!!
I could not access a single message to pass on. I had to send the drive to the manufacture and pay a fee to unlock the drive.
So, dont use a drive that can have a password. Because murphy will lock it for you!..

5. In the end, the whole operation was a success and I am very pleased. and I am impressed with the OHDEN NCS who participated.

6. Tony, KC8UR took the midnight to 6am shift on Saturday/Sunday. He did not handle on piece of traffic. So next time instead of asking a whole 24 hr period be constantly covered, we will break up in blocks of time. If activated for real, then we will have a constant watch.

I hope that my experinces will help the next station and be better prepaired.

I will transmitt this comment via MT-63.

73,
Gary, NJ8BB OHDEN NET MANAGER

5831. Cheap Fuse Holders

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-07-10 19:59:36 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5831 Message: 5831

Here's a forward/reply I just sent to the Skyview Radio Society yahoo group regarding ICOM fuse holders.

-Dave, KB3FXI

Good stuff, Mike.

I suspected this issue with my IC-7200 as I could see voltage drop on the lighted display when transmitting and noticed my fuse holders getting warm.

I just made a $10 investment at the local Radio Shack and put 2 new 30A mini blade fuses in line and all is well.

It's amazing to me that ICOM would make a mil spec rig like the IC-7200 and then put such a cheap power connector and fuses on the unit. But, no other complaints on the IC-7200 otherwise. I beat the living daylights out of the rig with long, high duty cycle, digital work and it plays like a champ.

>
> I rarely post anything original here but I know they are a lot of Icom IC7000 owners who read this board.
>
> I was noticing recently that my 7-year-old IC7000's output power was much less that 100 watts. I first noticed it on the rig display PO meter then decided to check it with my wattmeter. Sure enough the two meters agreed. The power was around 75 watts on some bands and down to 50 watts on other bands. So I decided to do some googling on the subject and found an IC7000 FAQ document. I guess I never paid that much attention to it before because I'm sure it's been an issue for a while.
>
> And here's what it said was the most common cause of low output power--the in-line fuse-holders in the Icom-supplied power cable:
>
> -------------------------
> "The issue with the fuse holder isn't the connection of the wire to the contacts. The problem is with how the fuse holder's contacts DON'T wipe the oxide off the fuse's blade. The broad, smooth contacts in the holder are not aggressive enough to break through the oxide layer and form a clean, gas-tight contact with the base metal.
>
> If you look at a fuse blade on a unit with excessive voltage drop under a microscope there is a thin dark line where the contact meets the blade. This oxide layer creates resistance, which creates heat, which accelerates the formation of more oxide and causes the voltage drop to slowly increase with TX time (and high current draw).
>
> Removing the fuse and wiping the contact with contact cleaner will reduce the voltage

drop temporarily, but it will always return in weeks or months. Heat, humidity and current draw accelerate the oxide regrowth.
>
> A standard automotive style ATC fuse holder has a much different type of contact that bites through the oxide and applies a much higher force per unit area. This is ensures a long-term reliable connection
> under high current.
>
> The poor design of the Icom fuse holder is the #1 cause of low transmit power on HF. But it also contributes to increased intermodulation products on voice peaks because of the unstable voltage supplied to the PA."
> ---
>
> Just make sure the automotive type holders you buy are rated for the 30-amp fuses. You can clean up the fuses but they will oxidize again, so a new fuseholder is a permanent fix. Get ones with at least 12-gauge pigtales, better yet 10awg if you can find them. (Maybe the guy who hates cars has a good source for these).

Hello all,

NBEMS alpha team continues testing alpha versions of FLDIGI and FLAMP. I've been working near 60 hours a week and have not had a lot of time to put into testing but it's looking like the latest alpha's are shaping up nicely.

FLAMP is is working very nice with some of the faster modes (Thor 50x1 and 4xPSK125R) going between a few ops with medium and larger messages and it may very well shape up to be a great protocol for bulletins, too.

For those not familiar with FLAMP, here is the help file for the latest alpha (I would suspect this will remain mostly unchanced when the next FLAMP release comes out):
http://w1hkj.com/alpha/flamp/Flamp-Guide-Ver-2.1.pdf

Let us know if you have any questions or if you have either already done some testing or if you would like to help with testing.

Also, anyone on the list here are welcome and encouraged to send out some testing reports and information about exercises or nets in which you have been involved in your area. What works, what areas need improvement, etc.

Attachments: 1 described; binary payloads are missing from this source WARC

I have been using the new alpha version of FLdigi with Windows 7 Pro OS.
I have had a number of crash's. I was transmitting or just receiving FLAMP
and the program closed without warning.
When I started over it didn't save the mode that I was working.

Anyone else have this problem ??????

Tnx de Skip K3CC

Skip,

3.22 is a different version that has packet. We always run the 3.21 vs.

Here's the current alpha versions:
http://w1hkj.com/alpha/fldigi/v3.21/
http://www.w1hkj.com/alpha/flamp/

5835. Fw: [NBEMSham] fldigi / flamp - New Releases [2 Attachments]

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-07-29 22:09:01 UTC
From: David Kleber
Topic: 5835 Message: 5835

Hello all,

We'd highly recommend updating to both the newly released versions of FLDIGI and FLAMP which are available at www.w1hkj.com/download.html

Keep in mind that to copy the FLAMP file transfers between other stations and on nets, all you have to do is have both FLDIGI and FLAMP opened. The software will automatically detect FLAMP and after 100% confirmation is given, you have the ability to save the file in FLAMP.

FLAMP is an unconnected mode, so a single transmission can be copied by an unlimited number of stations.

Check out the help files and give it a shot.

Suggested modes with FLAMP on HF are:
MFSK 22
4xPSK125R
Thor 50x1

On VHF/UHF simplex or repeater, try:
5xPSK125R
10xPSK125

Subject: [ny-nbems] Taming the Wild COMport in Windows

Thanks to W1HKJ for pointing out this webpage
(https://fedorahosted.org/fldigi/wiki/Documentation/HOWTO/Windows_USBSerial)

Taming the Wild COMport in Windows

In Windows XP (Windows Vista and 7, too) you get a new and different COM port each time you plug a USB-Serial cable into a new and different USB receptacle on a hub or the computer. Each time you plug the cable into a new USB receptacle, you must go and manually change the port assignment if you want the same device to always appear at the same COM port number.

To change a port number, use Device Manager and expand the Ports (COM & LPT) section (Start -> Run -> devmgmt.msc):

Double-click on the device (or right-click and select Properties)

Select the Port Settings tab and then click the Advanced button

Select a port number which does not correspond to an existing hardware (built-in) port in the COM Port Number drop-down list and click OK.
Ignore "(in use)" in the drop-down list if you have previously assigned the device to the same port number.

When you later re-connect the same USB<>Serial adapter, to the same USB port on the PC, it will re-appear again at the Com Port you just assigned it to, i.e. It's a "Sticky" setting. But, if you have a different adapter (even the same make & model) or connect the same one to a different USB port, you'll have to do all this again.

You can play tricks with this, to make one adapter show up always as the same COM port, or different COM ports, when plugged into different USB ports on the PC.

However, note that if you insert a hub between the PC and adapter, it gets very messy very fast, with way too many combinations for sanity.

Hi,

When using flmsg blank, after u fill in the blank and then u go to save it under Template it strips out the data. However, if u save it under File it save it OK. And u can open it. Shouldn't u be able to save it under Template? Or maybe I don't understand reasoning for Template.

I just tried to save a blank form I have no idea where it went
when I tried to do a template save.

I'm still learning but how this is done is a good thing to know
if you wanted to make up a few forms before an event.

Larry,

Go to file and save it there. Then open it and it should be good to go.
Still don't know why u can't save it under Template. Don't know if s/w
oversight or intentional for a reason I don't know.

Larry,

It looks like you found a bug. It's been a while since I worked with any template files.

Here's what I found... in FLMSG I type up a basic template, got to template menu, click save as and make a name for the file then save. Then I closed FLMSG, opened it back up to the blank form view, go to template, click load, highlight the file and click open and then I get a pop up box that says "Empty file".

I'll be passing this bug report along to w1hkj and will let the group know what we find.

I have been using FLdigirol just to listen not transmit.
I was told it would not work with the new Flamp.
that I should download the new versions of FLdigi and FLamp you have listed below.
Then I was told a newer version of both were on the way
and to wait until the new versions come out.
since I have not gotten on the air yet
I'm open to any suggestions as what version I should use.

5845. 80m net this morning and FLAMP test

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-08-05 00:00:49 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5845 Message: 5845

Hello all,

We had a good turnout on the 80m net this morning with moderate conditions.

We put out an announcement urging folks to update to FLDIGI 33.21.73 and FLAMP 2.1.00 and that starting on Sunday Aug 11 we will start regular testing with FLAMP after the close of the net. We will be starting with the use of MFSK 32 and a short bulletin, repeated several times.

The purpose of the FLAMP transmissions will be to test the effectiveness of net activation bulletins that will provide basic information containing net activation, primary operation frequencies (not necessarily limited to digital ops) and very basic situational awareness information.

The tests will use MFSK 32 with RSID to simulate unmanned operations for copying basic info pertaining to a net activation. The theory is, stations can leave their stations, unattended, with FLAMP running in the background, and their receivers set to a designated monitoring frequency. The FLAMP file will be repeated multiple times to help assure that as many stations as possible copy the file transmission.

After the close of the net we did an impromptu test of FLAMP test with good success from several stations reporting 100% receipt of the file which was transmitted with a 4x repeat.

Please spread the word to all NBEMS groups to update to the current versions of FLDIGI and FLAMP at http://w1hkj.com/download.html

Just remember that FLAMP has to be open and running in the background with FLDIGI as it does not auto open the way that FLMSG does.

Recommended modes for FLAMP testing are:

MFSK 32 - short messages with multiple repeats

Thor 50x1 for manned ops, medium size messages to one or a few designated ops under moderate to good conditions

4x or 5xPSK125R for manned ops, medium to larger files to one or few designated ops under good conditions

And, on VHF/UHF, try FLAMP with 5x or 10xPSK125R centered at 1500 Hz and 12xPSK125R at 1750 Hz center waterfall.

And let us know how your testing of FLAMP works out and feel free to post any questions you may have here on the paNBEMS yahoo group list.

Great stuff Dave.
Summer months do not leave me much time for radio except late evenings.
At the end of the month back on the road doing safety training/consulting.
Winter months is radio time for me.
Just got my SCS PTC-IIIusb so hope to have it up soonest.
Will try and monitor as best we can. Have been active with digital sending
Kim at VOA many reports and logs of the VOARadiograms...

Have a great summer what's left of it, we are still waiting for it to arrive
up North.

Fred

Subject: [paNBEMS] 80m net this morning and FLAMP test

Hello all,

We had a good turnout on the 80m net this morning with moderate conditions.

We put out an announcement urging folks to update to FLDIGI 33.21.73 and
FLAMP 2.1.00 and that starting on Sunday Aug 11 we will start regular
testing with FLAMP after the close of the net. We will be starting with the
use of MFSK 32 and a short bulletin, repeated several times.

The purpose of the FLAMP transmissions will be to test the effectiveness of
net activation bulletins that will provide basic information containing net
activation, primary operation frequencies (not necessarily limited to
digital ops) and very basic situational awareness information.

The tests will use MFSK 32 with RSID to simulate unmanned operations for
copying basic info pertaining to a net activation. The theory is, stations
can leave their stations, unattended, with FLAMP running in the background,
and their receivers set to a designated monitoring frequency. The FLAMP file
will be repeated multiple times to help assure that as many stations as
possible copy the file transmission.

After the close of the net we did an impromptu test of FLAMP test with good
success from several stations reporting 100% receipt of the file which was
transmitted with a 4x repeat.

Please spread the word to all NBEMS groups to update to the current versions of FLDIGI and FLAMP at http://w1hkj.com/download.html

Just remember that FLAMP has to be open and running in the background with FLDIGI as it does not auto open the way that FLMSG does.

Recommended modes for FLAMP testing are:

MFSK 32 - short messages with multiple repeats

Thor 50x1 for manned ops, medium size messages to one or a few designated ops under moderate to good conditions

4x or 5xPSK125R for manned ops, medium to larger files to one or few designated ops under good conditions

And, on VHF/UHF, try FLAMP with 5x or 10xPSK125R centered at 1500 Hz and 12xPSK125R at 1750 Hz center waterfall.

And let us know how your testing of FLAMP works out and feel free to post any questions you may have here on the paNBEMS yahoo group list.

5848. NBEMS Updates

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-08-06 14:15:07 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5848 Message: 5848

Hello all,

It's been a busy summer for me as I've been working 6 days and about 60 hours a week, but I've still been able to squeeze in some time on NBEMS testing and I'm keeping our weekly training exercises on track.

We had a lot of new folks here on the list and I just wanted to give a bit of basic information on NBEMS and our paNBEMS operations.

I am continuing running as net control for the Sunday morning 80m paNBEMS net at 9:30am ET on 3.583 USB. Big thanks goes out to Frank Rocap, N3FLL, in Chester County for handling net control duties for the paNBEMS Sunday 40m Net at 11am ET on 7.0725 USB. Frank has picked up the ball for me as I now work mandatory weekend schedules and the 11am 40m net time conflicts with my work schedule.

All are welcome and encouraged to check in on the paNBEMS nets. Please make sure you are running the current versions of FLDIGI, FLMSG and FLAMP at www.w1hkj.com/download.html

For those who are new to NBEMS, the system runs on free software available for Windows, Mac and Linux. The software uses any standard integrated, or external, computer sound card as a modem to translate text to digital audio and on the receiving end the software converts the digital sounds back to text. The software will work with any receiver to copy the messages and files and with any transceiver that has voice transmit and receive capabilities to both send and receive digital messages and files. The primary software program in the NBEMS suite is FLDIGI.

FLMSG is a well established helper application in the NBEMS suite that allows us to send and receive common ICS forms as well as CSV database and spreadsheet files. All FLMSG files and messages can be confirmed as 100% accurate though the automatic calculation of embedded checksum data in the transmitted message. The FLMSG messages are trasmitted, or broadcast, in a one to many protocol, so a single uninterrupted bulletin message trasmission can be received by an unlimited number of receiving stations, whether they be manned or unmanned.

The latest development in NBEMS is the the addition of FLAMP (Fast Light Amateur Multicast Protocol) which also provides 100% checksum confirmed receipt but it more geared toward file transfers. Just like the FLMSG, FLAMP is also a one to many protocol but allows us to designate automatic repeats of the file transmission to assure that as many stations as possible are able to receive with 100% accuracy.

The FLAMP protocol, which has been under testing and development since about the first of the year, is already proving to be very effective for short bulletin messages. FLAMP is now out of alpha and beta testing and available for free download at www.w1hkj.com/download.html. FLDIGI, also available at the same site, must be opened first, then FLAMP is opened and must be running in the background to automatically receive any monitored FLAMP file transmissions.

In addition to short bulletin messages, FLAMP has proven to be extremely valuable for passing relatively large files on moderate to good HF paths within about a 250 mile radius on our 80m nets and about 350 mile radius on our 40m nets. FLAMP breaks a message into user defined, checksum calculated blocks. When a large file is sent to one or a few designated recipients on an established HF path, the receiving stations either confirm or deny 100% reception from the single, uniterrupted transmission. Those not receiving 100% can send a report back to the originating station, specifying only the checksum blocks that failed. The originating station then only resends the missing blocks which allows us to send large files, then fill requests, greatly reducing the transmission time as compared to having to try a complete resend of the entire file.

With some of the fast modes on HF, we now have the capability of reliably transferring up to about 20k files on moderate to good paths to multiple receiving stations.

I would encourage those interested (even non-hams) to download FLDIGI, FLMSG and FLAMP. I will be glad to assist in the setup and configuration which usually doesn't take longer than about 10 or 15 minutes. Once the software is configured, all you need is a working computer microphone and an HF receiver.

Please do us a favor and distribute this message as an open invitation to any and all who would like to work with the NBEMS software and our nets.

Thanks!

Topic: 5849 Message: 5849

Hello all,

At 3pm ET today I will transmit a short FLAMP bulletin with MFSK32 on 14.0645 USB, 1500 Hz center waterfall. The message will be short and repeated several times over a 10 minute span.

I'd appreciate any reception reports or a reply on the air after the test.

Make sure you have the latest versions of FLDIGI and FLAMP and have FLAMP open and running.

Thanks.

From: paNBEMS-owner@yahoogroups.com
Topic: 5850 Message: 5850

In the US NE we now have well established NBEMS groups in ME, New England and NY.

It would be fantastic if we had more activity South of PA.

If an MD/DC NBEMS group or net were initiated, they could provide critical links to DC, of course, as well as relay down to the active NBEMS groups in the SE areas such as SC, NC and GA.

paNBEMS is also very interested in recruiting WL2K and D-Star stations as liaisons to and from those services/protocols and the established NBEMS nets.

If anyone is in WV or MD/DC and would like help or suggestions in getting an NBEMS net established, please feel free to contact me directly or reply here on the paNBEMS list.

My wife and I have lost our place because of a error in our
records. We have to wait agn for another opening.

Dealing with the county and government is very frustrating . Not only do
they
want everything you own to go on Medicaid, they check up on everything you
have or had in the last 5 years......

I now hear I can't sell equipment for my price. It must be turned over to
them
to sell.

5852. FLAMP and MFSK32

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-08-08 23:08:35 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5852 Message: 5852

Hello again, all.

After a few days of testing, I have to say that I'm very impressed with MFSK32 as a great compromise mode on HF between the high speed Thor 50x1 and PSKR multi-carrier modes and Olivia 8/500.

Special thanks to Kim, KD9XB, of Voice of America Radiogram, for pointing out the fact that on the VOA shortwave broadcast testing that MSFK32 was one of their top performing modes.

N3FLL, WB0KGN, KD2DO, K3CC and others did some great testing this week with MFSK32 with FLAMP on 20m and had very good success.

I'm interested to know if any other NBEMS groups have tested MFSK32 with FLAMP and what kind of results you have had.

With good conditions today, N3FLL and I also had good success on FLAMP with 4x and 5xPSK125R, Thor 50x1 and PSK250R and PSK500R.

There's no substitute for testing these modes under actual conditions.

Please get on the air with these modes and FLAMP and give your feedback here on the list. We would greatly appreciate your reports.

You can save and load multiple macro files. Tailor a set for the given requirement and load when needed.

This information relayed from KK5VD
FLAMP 2.2?

In/Cross Band BBS via Minimal Directory Services Protocol

Config files for inband frequency band range.
Config files for user access levels.
Database for each file access permissions and associated parameters.

Add tab panel for MDSP Configuration.
FLAMP to FLAMP Ip Address
FLAMP to FLAMP Ip port
Connect/Disconnect FLAMP <-> FLAMP

Broadcast Priority X File listing at interval X
Broadcast Priority X File listing while connected
Allow Cross band operation
Allow File Posting.
Allow File Listing.
Allow File Transmitting.
Remove incomplete files in x mins
Close inactive connections in x mins
Auto save all received files to MDSP directories (from user FLAMP file transfers).
Remove file from RxQ after 100% copied and saved.
Enable Interval Timer (Needed for multiple connects).
Tx Mins/Rx seconds
Retry Timeout in X seconds
Compress Listings
Encoding Listings using Base64/128/256
Enable Server or Client (not both)

Add MDSP Command Panel (Server):
Who's connected.
Current operation and status.
Transfer FLAMP 1 RxQ File <-> FLAMP 2 TxQ
Suspend/Continue MDSP.
directory.db editing.
List Priority X files from CallSign

Add MDSP Command Panel (Client):
Are we connected.
Current operation and status.
Connect to BBS Callusing (Hand entered or from Received list).
Connection commands.
List received file from station X.
Clear list.

```
Transfer FLAMP 1 RxQ File <-> FLAMP 2 TxQ
Transfer MDSP file to TxQ
```

5861. Requesting input from the NBEMS community on FLAMP (Cross band Use).

From: Robert Stiles
Topic: 5861 Message: 5861

Hello, NBEMS Users

The basic idea is to have the ability to transfer files via a cross band setup without users manually transferring files between two running FLAMP programs. A BBS type system seem to fit the bill.

What information needs to be provided that is associated to the file?

What Additional text fields will need to be added to FLAMP transmit/receive panel. In order to support priority level, from organization, to organization, etc,...

What are the definitions for a each priority level (life/property/support needed in x time)?

Does FEMA/RACES/ARES have these definitions which we can incorporate?

Perhaps extracting this information from a FLMSG file into the fields?

What is the minimal information needed for beaconing the directory listings? (Keep in mind the slow data on HF)

Can we define a standard alpha/numerical abbreviations that can be used to shorten the transmit time of file listings. Is there one that already exists.

We will just start with these and see what direction this goes.

Please post your answers and thoughts on Yahoo Groups NBEMSham, paNBEMS, or directly to kk5vd a t y a h o o d o t c o m.

HI Robert,
Many years ago I help run FlexNet a Packet System. That system worked on all bands with mixed modes.
However, it fell apart because many folks would not leave there equipmentor 24/7.
FlexNet would work on HF as well as VHF. Again, cost to op’s the use of multi radios and antennas,
could prove to be expensive. We can’t get folks to use a 2 transceiver, they buy cheap HT’s for VHF.

The other system would be a store and forward hub. Again the op would have to checkin to see if there where any traffic. Unless, there were a beacon system that would announce
“ traffic for K3CC “

I have used 3 FLdigi programs running on 1 computer ported by USB to VHF, HF and UHF. I could manually
send FLAMP by drag and drop between each window. Again, cost to the user.

I guess my bottom line is that we need more people in the program.

If you are looking for short message forms as radio grams you might checkout the ARRL message system we use on the WPA Phone and traffic net or ARES Numbered Relief Radio grams.

In regards to your question as to “what do the supported agencies need “, we have no idea here.
They area not sure how to fill out there own message forms.

I don’t know if I helped any, but your idea is neat . What you stating is that we open 1 FLdigi
program and port FLAMP messages to various transceiver's in the FLAMP window. Would
that mean that a FLAMP could be received via the various FLAMP Windows or just transmit ????

Skip,
FLAMP 2.2 will have a beacon, to let the users know a file server is online.

5867. Good information for FLAMP use on Repeaters.

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-08-14 03:11:44 UTC
From: Robert Stiles
Topic: 5867 Message: 5867

Paul,

FLAMP has little to do with RSID's in general. FLAMP is a data conduit for FLDIGI. RSID ID's are generated by FLDIGI when there is a state change from receive to transmit. This is controlled by FLAMP by sending a data stream to FLDIGI and monitoring the RX/TX state of FLDIGI. Then waiting a period of time before resuming the data stream again. This occurs when you use either Header Modem, or Interval timer options.

It's possible that the repeater uses tone filters to prevent DTMF and sidetone from being passed. I suspect this might effect RSID tones.

An easy test of this theory would be to used the same band as the repeater does and retest using simplex. Trying to mimic light of sight, received power levels, etc. If you live in an area with lots of ground clutter (buildings) multi-path could also be an issue. Using directed antennas can help negate some of the effects of multi-path over a ground plane antenna. Although, multi-path is more likely to effect the data stream then the RSID depending on the mode, baud rate, and the time delay of the same source signals.

When using Header modem, you can check to see if the following is occurring. Disable RXID and TXID in the upper right hand side of FLDIGI's window. While using Header Modem Transmit something via FLAMP.   What should happen is RXID and TXID will be enabled automatically.   If not, then there is a problem with control comms between FLDIGI and FLAMP and we will look into it.

Another possibility is the time it takes for the repeater to key up to the time FLDIGI starts sending data. Using pre-tone setting in the ID->RsID config panel might help.

When transmitting using header modem how much is the delay time between the header data and data stream (received state between the two transmits). If using Header modem only, not with interval timer, the max delay should be in the area of 1 to 2 seconds.

One thing you should note if using Head Modem alone on a repeater is the delay between the Header transmit data and the start of the data segment might be long enough for the repeater to unkey. It is advisable to enable Interval timer with Header modem to prevent this, keeping in mind the necessary Rx pause so the repeater has enough time to reset before transmitting the next round of data.

Selecting Interval timer does not automatically enable RX/TX RSIDs.

Interval Timer and Header Modem act the same (break in the header data and remaining data). So it's possible the operator may not have been using header modem and thus TXID and RXID may have not been enabled.

Please insure that you have the RxID (fldigi) sensitivity control set to
"2" when you are trying to use this feature.

Dave

On 08/13/2013 10:31 AM, Paul Newman wrote:
> Hello, Dave.
>
> Thank you for including the very desirable "Enable header modem" feature into FLAMP 2.1.00. During our Dallas NBEMS
Learning Net last Thursday night on the Richardson Wireless Klub 147.12 repeater, we tried using "Enable header modem" during our message training. Our slow opmode was MT63-2KL and our fast opmode was BPSK500. Our net participants represent a variety of station setups (soundcards, hard-wiring, acoustic coupling, computer operating systems, etc.). We did not have success with this new FLAMP feature.
>
> Subsequent testing outside the net on a good S/N 2 meter simplex path was not successful, either; no combination of FLDIGI/FLAMP configuration settings or opmodes that we tried resulted in consistent "Enable header modem" performance. What we are experiencing, specifically, is that the change from the slow opmode to the fast opmode in FLDIGI at a receiving station does not always occur, preventing decode of the body of the file. From our experience so far, we have observed:
>
> -- The TxID is not
consistently being transmitted by the TX station, including during "Fetch" /"Xmt".
> -- The TxID is not consistently being processed by the RX station when it is received, even when the TX and RX opmodes are the same.
>
> Please let us know how to properly use "Enable header modem" because it will provide a huge gain in reliability. We are eager to master this capability (we're in a competition of sorts with the advocates for RMS Express for local VHF/UHF EMCOM). Any assistance you can provide will be very much appreciated.

5868. NCS for Sunday 8/25 and 9/15

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-08-21 22:42:04 UTC
From: frankrocap
Topic: 5868 Message: 5868

Sorry for the late notice for this Sunday...but something has
come up that will probably not allow me to take the NCS job 8/25.
Also coming up in a few weeks 9/15 will be available. Actually
any Sunday is available if you would like give it a try.
On the yahoo page under "files" the first choice it "custom
macro sets"...one of which is for the 40M net. If you need help
e-mail Dave KB3FXI@...
or me at n3fll@... or call me at 610-430-7469
and I'll help you get set up.

Please:someone give this a try this...I guarantee you'll enjoy it.

73,
Frank N3FLL

There will be an FLdigi/FLAMP program at Ridgeway, PA

It will be held by the Ridgeway ARC N3NWL Sat October 20th at 1:30 PM
Ridgeway, PA Elk County Courthouse Annex
Please bring your laptop to load FLdigi and FLAMP

The program will be about 4 hours long covering the installation, setup and use of FLdigi.... Also FLAMP message handling

Jim,

There's a good chance that when you do a regular click on an unknown file to your computer system that the file will be saved in your browser download folder.

Try RIGHT clicking on the link and then selecting save target to a specific file folder that you can find by navigating your computer file system folders.

5880. VHF FLAMP test

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-08-30 12:38:47 UTC
From: <dave.kleber@...>
Topic: 5880 Message: 5880

Hello W1HKJ and all,

I finally got an opportunity to do some FLAMP testing tonight on VHF. Conditions here in Pittsburgh PA were acoustic coupling with my OLD TM261A to a felllow who was using a rigblaster on the other end in Johnstown, PA.

We tried to hook up on a purely RF path but I wasn't holding the common repeater between us well enough. We reluctantly switched to the WAN repeater system which is a VoIP linked Wide Area Network. I wasn't too keen on doing testing there, as we planned on tweaking everything up audio-wise on a purely RF repeater with the higher speed multicarrier modes before going to a wide area system.

Test results were great using the standard release FLDIGI 3.21.74 and FLAMP 2.1.00.

Last fall, we had done some fairly extensive testing on the WAN VoIP system with FLMSG but we got many reports of checksum errors with MT63 2k long and FLMSG. Most stations would report that the text looked nearly perfect or maybe they saw a few missed characters. Over VoIP linked systems, you will hear some occasional packet loss that is just enough to scramble a few characters, which of course will tank the checksum. So, our goal was to try 5x and 10xPSK125R with multiple repeats to see if we could fill in the errors more efficiently than the results we were getting with FLMSG and MT63.

We were sending both short and longer messages, primarily with 5xPSK125R. I was only acoustic coupling and had great results with 2x rpt and 2x hdr. We moved to 10xPSK125R and had good results there, too. 12xPSK125R proved useless with FLAMP but did pretty well with plain text.

As I hoped, FLAMP proved to be a big game changer on the linked system. What's great is, we can now send a single transmission with multiple repeats with the faster modes so that when receiving stations experiencing interference (which may occur differently to receiving stations on multiple links.. i.e. repeater id's, noise, drop outs) can all get the file block fills on the multiple resends in the same time that a single FLMSG/MT632k long transfer would take.

Another bonus with FLAMP is that there's really no setup involved like there is with FLMSG and walking through the process with new users on how to point to the FLMSG from the FLDIGI config settings.

We'll be sure to post more testing results as the other testing station seems to have been quite impressed and motivated to do more.

Fun Stuff!!

Thanks once again Dave (w1hkj), and all the programmers, for such an awesome digi comm system.

Give your Fldigi a workout before the net at 9:30am: VOA Radiogram at
9:00 am EDT on 6095 kHz...

This weekend, 31 August/1 September 2013, VOA Radiogram will include
sample text in Vietnamese and Russian.

There will also be experiments with RSIDs.

A Base64-encoded VOA logo will be transmitted in the very fast MFSK128
mode, with limited chance of success but worth a try.

More information:

voaradiogram.net/post/59765503446/voa-radiogram-31-august-1-september-20\
13-includes
<http://voaradiogram.net/post/59765503446/voa-radiogram-31-august-1-sept\
ember-2013-includes>

VOA Radiogram transmission schedule
(all days and times UTC)
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1300-1330 6095 kHz
Sun 1930-2000 15670 kHz
All via the Edward R. Murrow transmitting station in North Carolina.

Subject: [SATERNSouth] Arkansas NVIS / NBEMS 40 & 60 meter net tonight

In the spirit of cooperation we are posting this notice for those of you close enough to hear this net. They are asking for as many to participate as possible - so if you have the time and are so inclined here is the info from their Yahoo! Group page.

Meet tonight at 7pm Arkansas CDT

0000 UTC
7103.00 kHz center frequency
+/- for QRM

0030 UTC
5332.00 kHz center frequency
If QRM: go up one 60m channel at a time to locate transmission

Mode
DominoEX 11 or switch to other (NBEMS) mode per suggestion of Net participants.

Feedback from Fridays Net: briefly caught signal of N5ARM, but significant fading prevented meaningful communication. This presumed due to frequency significantly below MUF at that time. Hence 40m for tonight. Hope you can make it.

73 de Marcus NX5MK

Hope to hear your signals there....de AD5XJ

Hello all,

paNBEMS will be running a FLAMP test tomorrow, Thursday September 4.

We will open at 2pm ET on 20m 14.0645 USB 1500 Hz center waterfall with MFSK32. Make sure you have FLDIGI 3.21.75 set to receive RSID (RxID on) and have FLAMP open and running.

The first transmission will be a short text bulletin file, repeated multiple times with an approximate tx time of just under 10 minutes. The goal is to try to get 100% confirmation out to as many stations as possible with a short bulletin.

Following the 2pm ET 20m bulletin, we will look for reports. Depending on conditions, we may try some additional FLAMP on different modes.

At 3pm ET we will switch to 40m 7.0725 USB 1500 Hz center waterfall, using the same procedure as on 20m.

Keep in mind that FLDIGI and FLAMP work great in unattended operating mode. Just make sure you open FLDIGI 3.21.75 first, then open FLAMP 2.1.00, then set your receiver to one of the call frequencies and make sure you have RxID enabled.

FLDIGI 3.21.75 has vast improvements in RSID detection according to testing that N3FLL and I did today on 40m. We want to get more feedback to confirm the RSID improvements, so your participation would be greatly appreciated.

Reports can be given on the air, or to my email address at kb3fxi at yahoo dot com

Thanks!

-Dave Kleber, KB3FXI

Sorry to hear that must be in a null zone for both frequencies as I didn't hear anything on 14.065. 7.0725 was just fine.

Prior to the 20m transmission, I was spinning the dial on 20m phone and only heard one station over the entire phone portion of the band in ME who was running the Maritime Mobile net. 20m was not in good shape at all today. My station is set up strictly for NVIS, so I'm sure that didn't help.

We had good success on 40m with most stations within about 200 miles and managed to move a file back and forth to kk5vd, who is over 500 miles from my station, in Alabama.

I'm looking forward to more email reports when folks get home from work. Maybe we'll get a few more 100% confirmations.

As we get more folks involved in FLAMP testing, I'll be running some 20m tests from the big gun, WX3SKY, Skyview Radio Society near New Kensington, PA.

It's important to keep in mind that at any given time that we spin the dial on 20m, there's probably a multitude of stations on the air that we don't hear. Most of us spin the dial and cherry pick the strong stations... I'm guilty of this on both phone and PSK 31. It's an entirely different situation when you're trying to make a schedule to one specific station or when you're trying to reach a whole bunch of stations with a bulletin.

NBEMS success on 20m will rely on our strength in numbers for relays, just as is the case with the Maritime Mobile net. If we can ever expect to do as well as that net, we need WAY more folks on NBEMS.

It's fun testing on 20m, but, in my opinion, our bread n butter for NBEMS emcomm is going to be VHF/UHF and 80m/40m for a long time to come.

Dave,

I only copied a brief blurb from K3CC then he faded to the point of no decode on 20m. 40m a little better but only 14% of the FLAMP here. Bad propagation for distance today. Strange, as my 1600L digital SITREP was 100% first try using 1 watt for ICS-213 other station about 160 miles south of KC.

Let the list know when you try it again.

Ok, Larry.

I'm strictly NVIS so I wouldn't expect to do so well out to you in KS, over 700 miles away.

We had great results on 40m to our stations within 200 miles or so today and also managed to get a full file sent and received to KK5VD in Alabama, which was a stretch.

20m band was dead and my NVIS setup here does poorly unless conditions are extraordinarily good.

5896. Results, 20m/40m FLAMP Test, Thur Sept 5

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-09-06 16:16:27 UTC
From: David Kleber
Topic: 5887 Message: 5896

Ok... here's the results from the reports I got so far on the FLAMP test:

Station, State, 20m - % copy, 40m - % copy, distance from transmitting station (kb3fxi - Pittsburgh, PA)

kb3iuu, PA, 20m - 0%, 40m - 100%, 33 miles
w3iw, PA, 20m - didn't monitor, 40m - 100%, 50 miles
k3cc, PA, 20m - 0%, 40m - 100%, 130 miles
n7wwa, WV, 20m - 10%, 40m - 50%, 166 miles
n9vt, VA, 20m - didn't monitor, 40m - 100%, 204 miles
nx2i, NY, 20m - 0%, 40m - 0%, 225 miles
n3fll, PA, 20m - 0%, 40m - 100%, 228 miles
kb1wdl, ME, 20m - 0%, 40m - 70%, 507 miles
kk5vd, AL, 20m - 0%, 40m - 100% (after 2 additional block resends), 549 miles
ke5ohx, AR, 20m - 0%, 40m - 70%, 841 miles
wa6tvd, NV, 20m - 0%, 30m - 0%, 2100 miles

So, within 300 miles on 40m we had 5 of 7 stations report 100%. I suspect that one station may have had something set wrong and the other reported a very high noise level.

20m was a complete bust. Prior to the bulletin broadcast on 20m, I spun the dial on the phone portions on 20m and only heard some faint DX and one station in ME who was running the Maritime Mobile net on 14.300, so I think it's safe to say the band was dead.

When we do our next test, I'd like to get more data from the receiving stations, most specifically what antenna they're using and what height and orientation.

Thanks to all who pitched in on the FLAMP test. We'll announce when we do this again and I'd like to ask that we all invite our fellow hams to give it a shot. All they'll need is a computer, plug in mic and the free FLDIGI and FLAMP software. And... they don't even need to be at the station to copy. At least 3 of our reports came from folks who set up their stations while they were away from their station. Fun stuff!

For the next test, we'll give a much more advanced notice.

Subject: [paNBEMS] 20m/40m FLAMP Test, Thur Sept 4

Hello all,

paNBEMS will be running a FLAMP test tomorrow, Thursday September 5.

We will open at 2pm ET on 20m 14.0645 USB 1500 Hz center waterfall with MFSK32. Make sure you have FLDIGI 3.21.75 set to receive RSID (RxID on) and have FLAMP open and running.

The first transmission will be a short text bulletin file, repeated multiple times with an approximate tx time of just under 10 minutes. The goal is to try to get 100% confirmation out to as many stations as possible with a short bulletin.

Following the 2pm ET 20m bulletin, we will look for reports. Depending on conditions, we may try some additional FLAMP on different modes.

At 3pm ET we will switch to 40m 7.0725 USB 1500 Hz center waterfall, using the same procedure as on 20m.

Keep in mind that FLDIGI and FLAMP work great in unattended operating mode. Just make sure you open FLDIGI 3.21.75 first, then open FLAMP 2.1.00, then set your receiver to one of the call frequencies and make sure you have RxID enabled.

FLDIGI 3.21.75 has vast improvements in RSID detection according to testing that N3FLL and I did today on 40m. We want to get more feedback to confirm the RSID improvements, so your participation would be greatly appreciated.

Reports can be given on the air, or to my email address at kb3fxi at yahoo dot com

Thanks!

5898. Start an HF NBEMS net? Here's some tips.

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-09-07 02:42:03 UTC
From: David Kleber
Topic: 5898 Message: 5898

Hello again, all.

Here's a forward of an email message I just sent out to a ham who expressed some interest in starting up an HF net in his area...

If you have a 40m NVIS antenna that does well out to about 200-300 miles on 40m, that's where I'd recommend you start. In the first 5 years or so of paNBEMS, we concentrated almost entirely on 80m ops but we've come to find that 40m is our best band. The average ham, in a lot of cases, doesn't have the real estate to put up an 80m dipole (at least here in WPA and many of our metro areas within NVIS range).

When you start a net, and participation is expected to be low, you can just put out a typical prologue explaining the check in procedures, then call for general check ins. But if you put out a wide area announcement and anticipate a large number of check ins, break out your calls by county, district or general areas... I ran into a situation on paNBEMS once where there was an announcement that went out on a few email lists, that I was unaware of, and I called up the net with a general call and it was a genuine cluster.

Work your way up slow with just plain text messages without FLMSG or FLAMP and work with folks on the basics of their rig, software and audio settings. Once you have folks up to speed, then you can work into FLMSG and FLAMP transfers, but before you do, make sure you (as the NCS) have enough figured out and that you're prepared to handle setup and troubleshooting questions. BTW, feel free to contact me here on the list or at kb3fxi at yahoo dot com if you come across any issues our questions you can't address and I'll do my best to help.

Lastly, on EACH net, bring some good information to send out in the way of text, FLMSG or FLAMP. I have regular experience with training nets where all they send are run of the mill solar or weather reports that anyone could just pick up off the internet. Contact some local clubs and ask them if they have anything they'd like you to put out in a bulletin. Also, come up with some short text messages for useful tips or other information that will keep the participants and monitoring stations (usually more monitoring stations that you know) coming back... make it fun and interesting and make sure those new to NBEMS understand that they can get started with nothing more than their computer, a cheap plug in mic and the free software if all they want to do is monitor.

Don't be surprised if you put out your net announcements on local or regional nets, as well as to email lists, and you get few or no check ins on your first few months of nets. paNBEMS nets had many instances of one participant in our early days, and that was just lonely old me as NCS. But, as I said previously, you probably will have more folks than you could imagine just monitoring and testing the waters before they get up the interest or courage to check in (remember the first time you pressed the PTT as a new licensee?). If you get no check ins, no problem... put out a bulletin and thank all those who monitored.

I hope that helps. We've been at it with NBEMS almost since its inception back around 2006 and we still don't have the numbers we'd like, but we're having fun and making progress.

Glen,

Scanning usually assumes that the resulting file is a graphic or PDF, which are VERY large. There are some advanced NBEMS groups who are having success with sending scanned document files as PDF and/or JPG with the very wide/fast modes using FLAMP or FLMSG over solid VHF/UHF simplex and repeater channels. But I would HIGHLY recommend advising served agencies that what we're best suited to handle are plain text or CSV files sent with FLAMP or FLMSG, or the standardized forms in FLMSG.

The overhead in graphic files, MS Word, MS Excel, and other binary files is extreme and not very practical on amateur radio, especially HF.

I think it's just as important to point out our limitations as it is our strengths to our served agencies. There's a HUGE difference between the bandwidth and channel quality we're dealing with in amateur radio vs the internet, and it's important that they understand the difference between the two.

I've been involved in a lot of emcomm drills at the county and state level, not just as an amateur radio operator, and I can tell you from first hand experience that the VAST majority of the communications issues can be handled with plain text, CSV files and formatted messages such as the ICS forms in FLMSG.

I think it's a good practice to under-promise and over-deliver. Large graphic and binary file transfers, while they can be done, aren't really what NBEMS is all about.

Glen,

Good advice from Dave, here is an actual "test file" pasted below along with transmission times and size, Flamp used.

Type Mode Size Time
=======+==========+=======+======
Text PSK63RC5 423 b 27s
MS Word PSK63RC5 2721 b 2m 56s

Same exact message. one saved using MS notepad, the other MS Word (2003). The mode selected would be for HF use, we are constrained by Part 97 below 28 MHz to use a maximum data speed of 300 baud. Using PSK125RC4 transmission time is 1m 49s. Also transmissions longer than 10 minutes would need to meet the ID requirement for our stations.

Extremely long transmission times are unrealistic (20m or more) as most of our Ham transmitters are not 100% TX duty cycle. One of my scanned documents is 500 kb in size and using BPSK1000 the TX time is over 80 minutes.

David Kleber wrote:
Ok... here's the results from the reports I got so far on the FLAMP test:

Station, State, 20m - % copy, 40m - % copy, distance from transmitting station (kb3fxi - Pittsburgh, PA)

kb3iuu, PA, 20m - 0%, 40m - 100%, 33 miles
w3iw, PA, 20m - didn't monitor, 40m - 100%, 50 miles
k3cc, PA, 20m - 0%, 40m - 100%, 130 miles
n7wwa, WV, 20m - 10%, 40m - 50%, 166 miles
n9vt, VA, 20m - didn't monitor, 40m - 100%, 204 miles
nx2i, NY, 20m - 0%, 40m - 0%, 225 miles
n3fll, PA, 20m - 0%, 40m - 100%, 228 miles
kb1wdl, ME, 20m - 0%, 40m - 70%, 507 miles
kk5vd, AL, 20m - 0%, 40m - 100% (after 2 additional block resends), 549 miles
ke5ohx, AR, 20m - 0%, 40m - 70%, 841 miles
wa6tvd, NV, 20m - 0%, 30m - 0%, 2100 miles

So, within 300 miles on 40m we had 5 of 7 stations report 100%. I suspect that one station may have had something set wrong and the other reported a very high noise level.

20m was a complete bust. Prior to the bulletin broadcast on 20m, I spun the dial on the phone portions on 20m and only heard some faint DX and one station in ME who was running the Maritime Mobile net on 14.300, so I think it's safe to say the band was dead.

When we do our next test, I'd like to get more data from the receiving stations, most specifically what antenna they're using and what height and orientation.

Thanks to all who pitched in on the FLAMP test. We'll announce when we do this again and I'd like to ask that we all invite our fellow hams to give it a shot. All they'll need is a computer, plug in mic and the free FLDIGI and FLAMP software. And... they don't even need to be at the station to copy. At

least 3 of our reports came from folks who set up their stations while they were away from their station. Fun stuff!

For the next test, we'll give a much more advanced notice.

Subject: [paNBEMS] 20m/40m FLAMP Test, Thur Sept 4

Hello all,

paNBEMS will be running a FLAMP test tomorrow, Thursday September 5.

We will open at 2pm ET on 20m 14.0645 USB 1500 Hz center waterfall with MFSK32. Make sure you have FLDIGI 3.21.75 set to receive RSID (RxID on) and have FLAMP open and running.

The first transmission will be a short text bulletin file, repeated multiple times with an approximate tx time of just under 10 minutes. The goal is to try to get 100% confirmation out to as many stations as possible with a short bulletin.

Following the 2pm ET 20m bulletin, we will look for reports. Depending on conditions, we may try some additional FLAMP on different modes.

At 3pm ET we will switch to 40m 7.0725 USB 1500 Hz center waterfall, using the same procedure as on 20m.

Keep in mind that FLDIGI and FLAMP work great in unattended operating mode. Just make sure you open FLDIGI 3.21.75 first, then open FLAMP 2.1.00, then set your receiver to one of the call frequencies and make sure you have RxID enabled.

FLDIGI 3.21.75 has vast improvements in RSID detection according to testing that N3FLL and I did today on 40m. We want to get more feedback to confirm the RSID improvements, so your participation would be greatly appreciated.

Reports can be given on the air, or to my email address at kb3fxi at yahoo dot com

Thanks!

Fred,

We've missed you.

I'm looking forward to doing some FLAMP testing with you when you get back on the air!

Just drop a line with some schedules here on the list when you're ready.

Same thing goes for anyone else out there that would like to try their hand at sending some FLAMP bulletins for reception reports.

that one station may have had something set wrong and the other reported a
very high noise level.

20m was a complete bust. Prior to the bulletin broadcast on 20m, I spun the dial on the phone portions on 20m and only heard some faint DX and one station in ME who was running the Maritime Mobile net on 14.300, so I think it's safe to say the band was dead.

When we do our next test, I'd like to get more data from the receiving stations, most specifically what antenna they're using and what height and orientation.

Thanks to all who pitched in on the FLAMP test. We'll announce when we do this again and I'd like to ask that we all invite our fellow hams to give it a shot. All they'll need is a computer, plug in mic and the free FLDIGI and FLAMP software. And... they don't even need to be at the station to copy. At least 3 of our reports came from folks who set up their stations while they were away from their station. Fun stuff!

For the next test, we'll give a much more advanced notice.

Subject: [paNBEMS] 20m/40m FLAMP Test, Thur Sept 4

Hello all,

paNBEMS will be running a FLAMP test tomorrow, Thursday September 5.

We will open at 2pm ET on 20m 14.0645 USB 1500 Hz center waterfall with MFSK32. Make sure you have FLDIGI 3.21.75 set to receive RSID (RxID on) and have FLAMP open and running.

The first transmission will be a short text bulletin file, repeated multiple times with an approximate tx time of just under 10 minutes. The goal is to try to get 100% confirmation out to as many stations as possible with a short bulletin.

Following the 2pm ET 20m bulletin, we will look for reports. Depending on conditions, we may try some additional FLAMP on different modes.

At 3pm ET we will switch to 40m 7.0725 USB 1500 Hz center waterfall, using the same procedure as on 20m.

Keep in mind that FLDIGI and FLAMP work great in unattended operating mode. Just make sure you open FLDIGI 3.21.75 first, then open FLAMP 2.1.00, then set your receiver to one of the call frequencies and make sure you have RxID enabled.

FLDIGI 3.21.75 has vast improvements in RSID detection according to testing that N3FLL and I did today on 40m. We want to get more feedback to confirm the RSID improvements, so your participation would be greatly appreciated.

Reports can be given on the air, or to my email address at kb3fxi at yahoo dot com

Thanks!

-Dave Kleber, KB3FXI

Thanks for the report, Mike.

FLAMP is really shaping up nicely as a bulletin mode and for larger file transfers on HF to net participating stations with good established paths.

I came home from monitoring the 7.0725 paNBEMS 40m net after work to find a FLAMP file and 3 FLMSG files, all 100%.

Fun stuff!

I've been looking around, and I see on APRS that they have a WINLINK gateway set up on the east end of town. It's in a location where a couple APRS mobiles had been earlier, so I suspect it's a new setup. I see a few hams with APRS trying to get around in Longmont.

I have lots of family in that area - my brother's house is in the northwest corner of Longmont, and they are on an island there. My son is staying with friends in Greeley because his house is in the evacuation zone and the place where he works is flooded.

Final comments from NCS...

The latest standard FLDIGI release from w1hkj.com is 3.21.76 and has greatly improved RSID detection and improvements on the Thor and MFSK modems for weak sig decode. Please update to the latest version to take advantage of the improved performance.

Please invite friends, clubs and local net liaison stations to participate or monitor the paNBEMS nets. We would like to build participation over the winter months.

Testing of FLAMP continues to go well. Remember that you have to open the FLAMP application and have it running with FLDIGI in order to receive the digital file transfers.

Thanks to all for checking in this morning and special thanks to n3crm and n3gyw for the relay help. And, kb3fn, it was nice to see you with us this morning, Lynn... it's been a long time since we've last crossed paths on HF.

All are encouraged to check in on the paNBEMS 40m net every Sun at 11am ET on 7.0725 USB. K3CC in Potter Co PA should be our NCS today.

We'll close the 80m paNBEMS net now and I will immediately follow with a MFSK32 FLAMP file transmission. I will stand by for FLAMP reports and comments up until abt 10:40 AM ET when I will switch up to 7.0725 USB to monitor the 40m paNBEMS net at 11am ET.

73 and good day to all!

kb3fxi ncs paNBEMS
stand by for mode change to MFSK32 and FLAMP file transmission. make sure you have FLAMP running and RXID/RSID enabled on FLDIGI

Dave,

Make sure your "allowed errors" (I think that's the wording) in the IDs section of the configuration is set to zero or, at most, one. I had that issue as well, and for some reason it was defaulted to five, which causes false ID receptions. Since I dropped mine I've had no more issues.

Thanks very much, Skip, for taking the net again... great work and greatly appreciated.

This winter, we'll be working into recruiting more folks for the net and hopefully we'll get some more NCS voluteers. As you said, once you do one or two it's fun. And, nets are the time to make mistakes and learn. Lord knows I've made a lot of mistakes and learned a great deal running the nets.

The paNBEMS operating frequencies and protocols are the same as PEMA/ACS. One thing I like about PEMA/ACS is they're okay with allowing out-of-state operators to not only check in but to help with relays and act as NCS.

You can usually count on bad band conditions when they're needed the most, like in emergency situations. So, the PEMA/ACS philosophy of encouraging out-of-state station participation is a good one.

Thanks to all who are monitoring and checking in on the nets.

From: <k0rusham@...>
Topic: 5912 Message: 5923

Thanks for posting that, Dave!

I discovered that RecordMyDesktop, the tool that I use, was recording the audio at 22050 for the rate, and that may be causing the audio problem - hopefully that's the case. I jacked it up to 44100 and am thinking that might solve it, going to do some testing to see.

It's a shame, as it was basically a perfect reception, just a couple of errors in the MFSK128 that didn't really impact anything.

Subject: [NBEMSham] VOA Radiogram, 14-15 Sept 2013, includes Persian

VOA Radiogram for the weekend of 14-15 September 2013 will include a sample of text in Persian. It's interesting to watch it print out from right to left.

Also this weekend, VOA Radiogram will incorporate news about international broadcasting from a revived kimandrewelliott.com (http://www.kimandrewelliott.com/) .

The lineup of modes:

2:55 MFSK16: Program preview
1:45 MFSK32: Persian text sample
4:06 MFSK32: Al Jazeera says it's jammed from Egypt
4:24 MFSK32/Flmsg: New head of France 24
1:55 MFSK64: BBC in Japan and Daventry sculpture
2:59 MFSK32 image: Rendition of Daventry sculpture
:42 MFSK128: CNN in former Yugoslavia
:49 MFSK32: Intro to second MFSK64 transmission

2:25 MFSK64/Flmsg: Psyop in the news
2:35 MFSK32 image: Gaoxin-7 aircraft
1:15 MFSK16: Closing announcements
:30 Surprise mode of the week

More information about this weekend's program at voaradiogram.net/post/61065448218/voa-radiogram-14-15-sept-2013-includes-persian-and (http://voaradiogram.net/post/61065448218/voa-radiogram-14-15-sept-2013-includes-persian-and)

VOA Radiogram transmission schedule
(all days and times UTC)
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1300-1330 6095 kHz
Sun 1930-2000 15670 kHz
All via the Edward R. Murrow transmitting station in North Carolina

On a related note, The Mighty KBC, based in the Netherlands but using a transmitter in Germany, will transmit a minute of MFSK32 as follows:

Saturday, 14 Sept 2013 (today) at about 1130 UTC on 6095 kHz

Sunday, 15 Sept 2013 at about 0130 UTC on 7375 kHz (Saturday 9:30pm EDT)

North America listeners probably cannot hear the 6095 kHz broadcast of The Mighty KBC, but can try using this SDR receiver in the Netherlands: https://sn2prd0310.outlook.com/owa/radiogram@.../redir.aspx?C=JjmGpK1N2Ua3WTk71-Li04RVJ513hNAIUN_MBTCORmmyfyF-SWb9IAI3FIdhyif_80k_tBZkoPs.&URL=http%3a%2f%2fwebsdr.ewi.utwente.nl%3a8901

For listeners in eastern North America in the skip zone for VOA Radiogram on 17860 and 15670 kHz, this SDR receiver in the Netherlands is a good alternative.

Very good point, Tim.

The setting is under FLDIGI, Configure, Misc, ID. It's a slider adjustment, I think labeled "Allow Errors".

I have mine set to "1" and it's been working great. The 3.21.76 version of FLDIGI really made HUGE improvements on RSID detection, which is critical for the folks who monitor emergency call/bulletin frequencies with unmanned monitoring stations.

Thanks for the tip, Tim.

My understanding is that, at least for PSK, you actively don't want to see full power because it is a 100% duty cycle mode and you'll blow out your finals. You control that by setting for full power on the transmitter, but keeping the audio drive low enough to not drive the full power.

Am I wrong? Sometimes I wonder, with the way I get blown away by some stations on my modest dipole here in Colorado, if there aren't a decent number of people cranking it up who will pay the price. But if a station has, say, a 1 KW amplifier, does that mean they can drive PSK31 to 300 watts or so?

I've always experienced reduced power out with most of the wider modes, especially on MT63. I checked into it a long time ago and it's perfectly normal to only get about 1/2 power out on MT63, and a bit of a reduction on some of the other wider modes.

I also have found that you see the biggest improvements in reception when the sending station goes from 1 watt to about 10 watts and a slight improvement going from 10 watts to 50 watts.

At the WX3SKY station, we did a test one day with MT63 1k long, going from about 35 watts or so up to about 350 watts, with the use of a linear amp. The two or three stations who were receiving reported little or no difference.

I usually run between 35-45watts. Try starting there sometime, then do a test in a qso where both stations then go to 10w, then 5w, then 1w or less. You'll be suprised at how low you have to go before you see decoding errors.

Tim,

The way I adjust is to set power level for 20 watts (covers all US) from
there adjust the audio drive for no or little ALC action on the radio.
That mostly translates to 10-12 watts power out. When using my FT-817
that same adjustment scheme gives 2-3 watts on the 5 watt setting.

Actually with reasonable HF band conditions the FT-817 set on 1/2 watt
Olivia or MFSK is 100% copy in-state using NVIS antenna.
With poor band conditions, I'd question if 500 watts would work. While
Part 97 says we 'can' run 1500 watts - another section says use the
minimum power necessary for contact. Using lower power levels does allow
for more to use the bands.

Okay, that tracks with what I was thinking, thanks.

So, given the previous comment about 300+ watts with an amp being possible, I have a feeling that's what is going on when my entire waterfall gets knocked out. I'm thinking it's the typical people who read things that say "30 watts is plenty" and think, "yes, but 300 watts is killer!".

Anymore my main mode of operation is to run on 14.070 until I just can't stand the madness any more with stations that are taking over my whole waterfall and making it impossible to communicate with anyone else. Then I go up to 14.0725 or so and either find some Olivia or call CQ on MFSK16 and see what happens. Funny how once you get off the beaten path a bit, the people there seem quite a bit more reasonable.

"I am Tim's disillusionment".

I've been operating with my TS-480 set to 100 watts and dialing the audio drive to get right about 30 out showing on the meter. That's gotten me tons of good reports remarking on my nice, strong signal. Silly me for trying to be nice to others, guess it's time to start saving up for a legal limit amp and lots of ferrite cores.

Just to be clear, this is NOT in any way directed towards anyone here, appreciate the conversation.

Tim,

I have a USB Signalink and I run my rig at full power then adjust the TX knob on the signalink to my desired power out according to my rig meter.

The key to not making a mess of the band is to monitor your ALC on the rig and adjust your audio levels in the computer (main and wav) so that the ALC registers little or no reading.

Hams can make a terrible mess on the bands with 5w and a high ALC. I don't think running high power, as long as the ALC is at a minimum, does any harm... although, it's completely unnecessary.

The problem I have noticed is the different modes of FLdigi have different drive requirements.......
I have my transceiver set for about 35 to 40 watts output....... That gives me about 25 watts output signalink .... The TX is about 50 % for Olivia 8-500
When I use PSK125RC4 the output is less then 10 watts..... I then have to turn the TX up 100% on the Singnalink and increase me transceiver to 90 watts...
The difference in audio tones drops my output on the Orion I
If I adjust the TX EQ to −20db I can increase the output to almost 40 watts

I did not have this trouble with the TS590 or my TS 480

When I get the urge to operate with more power, I typically move to 14.1075, or 14.1065, and use Olvia 32/1000. DX is available during the day...more so in the morning but also in the afternoon.
And there I have found that power does make a difference. Particularly if the station you are working is in an industrial city....they seem to be a bit more noisy. But also, it is not as crowded as the area around 14.070. Your chances of making a contact are also less. You can't have it all. Qsos are likely to be longer and conversely there will be fewer qsos that are merely an exchange of buffers.

One way to produce audio distortion is to set up lots of audio from your sound card, and then use
Fldigi's attenuation control to cut the drive to your radio. This causes flat topping of the audio sine wave. Flat topping = distortion=harmonics. You can also cause distortion by using your rig's power control setting to reduce power instead of reducing sound card audio output. Watching the ALC reading is the main way to reduce distortion, but it is not the only way.

Topic: 5936 Message: 5936

I have fldigi and flmsg installed on my Mac using OS 10.8.5. When I receive a message or form the folder windows opens but the form will not open in either the browser or flmsg. I have checked the config file and made sure the location of flmsg is correct. I have uninstalled the software and erased the folders for fldigi and flmsg and reinstalled with no success. Does anyone have this software running on a Mac successfully?
Any help would be appreciated.

If you dragged the application into the text frame you will also need to append Contents/MacOS/flmsg to the file path. The application.app is just a folder and the true executable is located in that folder.

With the kind help from Ed KB3TOX, I have Fldigi & Flmsg up and running on my Mac. Seems it is not as clear cut telling Fldigi where Flmsg resides on your hard drive. The "exe" file that the program is looking for is actually contained in the package contents of the Mac application. Once that was corrected, it works fine.

Thanks again Ed and the group for providing the tons of info on these programs.

5939. NBEMS test - Thur Sept 19

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-09-18 22:08:05 UTC
From: David Kleber
Topic: 5939 Message: 5939

Hello all,

paNBEMS will be running a FLAMP transmission test from the Greater Pittsburgh Area tomorrow at Noon ET on 40m 7.0725 USB, and at 2pm ET on 14.0645 USB with mode Thor22. Center waterfall spot will be 1500 Hz.

All that is needed to receive the bulletins is an HF receiver, the free NBEMS software, and a computer with a working microphone.

After the short file transmissions, we will stand by for reports.

For those who won't be at their stations, please consider setting up FLDIGI and FLAMP to monitor and send your reports to kb3fxi at yahoo dot com.

Please use the current FLDIGI 3.21.76 and FLAMP 2.1.00 versions with FLAMP open and running.

The free software is available for download at:
http://w1hkj.com/download.html

FLDIGI RSID should be configured to detect Thor22 by going to FLDIGI, Configure, IDs, then click "Receive Modes" and confirm that Thor22 and MFSK32 are both checked. On the main screen of FLDIGI, in the upper right hand corner of the screen, make sure that RxID is checked and enabled.

The transmissions will be a very small plain text file simulating an emergency net activation. The FLAMP transmissions will be near 10 minutes in duration with multiple resends to try to ensure the widest coverage possible.

One additional note prior to the test today. In FLDIGI, click on Configure, then click IDs. In the resulting window, change the "Errors" slider to 1, then click save and close. In FLDIGI, make sure the RxID in the upper right corner of the window is check marked. These are the optimum settings to help ensure that the proper mode is selected automatically at receiving stations.

BTW, I had a good test with ww3a in GA from here in Pittsburgh just a little while ago. Reed got the FLAMP file 100% on his first ever use of FLDIGI/FLAMP.

Fun stuff.

Good copy on both stations, KB3FXI and AE6LA 100% Flamp. Some QSB on 20m but the 'repeat' saved the day. Not so good on 40m, maybe 15% copy. Time of day for 40m plays a role for distance.

Thank you for announcing the test,

From: paNBEMS-owner@yahoogroups.com
Topic: 5949 Message: 5949

Thanks to all who participated in the FLAMP test yesterday.

I estimate around 16 stations reporting 100% on the 40m test and around 6 reporting 100% on 20m.

As usual, 40m seems to generate the best results. Thor22 performed well, and in spite of the fact that the 40m test was conducted from my home location on a G5RV setup for NVIS, we received 100% reports from NM, GA, ME and IN. With the excetpion of a a few stations, the vast majority of those within 300 miles of my location reported 100% on 40m.

A few stations reported what looked to be perfect text in the receive window of FLDIGI but nothing happened in FLAMP. Although I can't be certain, I suspect that this may have been a result of running older versions of FLDIGI that are not compatible with FLAMP 2.1.00.

The 20m FLAMP transmission was sent from WX3SKY, Skyview Radio Society, near New Kensington, PA in Western Pennsylvania. We were running 75w to a 2 element quad up about 35'. During the 10 minute transmission, I swung teh beam for each of the repeats from S to W to N to E.

Unfortunately, I forgot to save my text log but we had fairly good results on 20m with a bit of a smaller audience.

A few stations reported light copy and the receive was not good enough for FLAMP file confirmation. AE6LA in CA reported 100% copy and at my request he did a 2x repeat resend which allowed a few more stations to confirm 100%.

The goal of the test was to show one aspect of FLAMP for use in transmitting short bulletin messages to the widest coverage area possible. This is accomplished through the use of the slower, narrower, more robust modes, and multiple repeats of the short bulletin file in a single transmission, followed by repeats from relay stations.

The key to success on 20m will be to increase participation and utilize relays, which is something paNBEMS will be working on this winter.

Thanks again to all who helped make the 40m/20m FLAMP test yesterday a great success.

Please feel free to post your comments, questions and observations here on the list so we can all learn from each other.

As Dave mentioned and I have shared with people I help with the software, FLDIGI should be opened first and then FLAMP. If I restart FLDIGI, I have had to restart FLAMP. I like that the source code is open and am guessing I should download it to look at. I think that FLAMP does not attempt to re-connect to FLDIGI if it fails the first time.

73,
Jim

Greetings,
Below I have an answer to launching FLAMP after FLdigi
very simple>>>>>>

I have tried to launch FLAMP after opening FLdigi.
So far I have not found a way from FLdigi....

Now, I know I'm not the sharpest knife in the drawer....

I have found an easy way to access both FLdigi and FLAMP .

The simplest idea is to pin FLdigi and FLAMP to the task bar. This will allow you to see FLAMP after you launch FLdigi.. No more looking for FLAMP on the desk top....

Sometimes the simplest are still the best.......

The operator has to remember to open FLdigi first and then FLAMP.....

Subject: [paNBEMS] Sept 19, 2013 FLAMP Test Observations

Thanks to all who participated in the FLAMP test yesterday.

I estimate around 16 stations reporting 100% on the 40m test and around 6 reporting 100% on 20m.

As usual, 40m seems to generate the best results. Thor22 performed well, and in spite of the fact that the 40m test was conducted from my home location on a G5RV setup for NVIS, we received 100% reports from NM, GA, ME and IN. With the excetpion of a a few stations, the vast majority of those within 300 miles of my location reported 100% on 40m.

A few stations reported what looked to be perfect text in the receive window of FLDIGI but nothing happened in FLAMP. Although I can't be certain, I suspect that this may have been a result of running older versions of FLDIGI that are not compatible with FLAMP 2.1.00.

The 20m FLAMP transmission was sent from WX3SKY, Skyview Radio Society, near New Kensington, PA in Western Pennsylvania. We were running 75w to a 2 element quad up about

35'. During the 10 minute transmission, I swung teh beam for each of the repeats from S to W to N to E.

Unfortunately, I forgot to save my text log but we had fairly good results on 20m with a bit of a smaller audience.

A few stations reported light copy and the receive was not good enough for FLAMP file confirmation. AE6LA in CA reported 100% copy and at my request he did a 2x repeat resend which allowed a few more stations to confirm 100%.

The goal of the test was to show one aspect of FLAMP for use in transmitting short bulletin messages to the widest coverage area possible. This is accomplished through the use of the slower, narrower, more robust modes, and multiple repeats of the short bulletin file in a single transmission, followed by repeats from relay stations.

The key to success on 20m will be to increase participation and utilize relays, which is something paNBEMS will be working on this winter.

Thanks again to all who helped make the 40m/20m FLAMP test yesterday a great success.

Please feel free to post your comments, questions and observations here on the list so we can all learn from each other.

5957. Starting FLAMP from FLDIGI using Notifications

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-09-21 01:41:36 UTC
From: Robert Stiles
Topic: 5949 Message: 5957

Hello all,

For those who want FLAMP to auto execute this is one way to perform this task. It not perfect, but it works.

Under configure->notifications.

In the Event (upper left) section of the panel select Custom text search.

in the RE: text input type PROG

On the lower right hand side select the folder icon and locate FLAMP executable

On MacOSX the path would be something like:

/Applications/flamp-2.1.00AB.app/Contents/MacOS/flamp

Return to the upper left hand side and enable the event.

Over to the upper right hand side adjust trigger limit to 1.

Return to the lower center and press the add button.

Press the test button, enter PROG (you may have to delete the current text first) and press OKAY, if it works FLAMP should be up and running.

If it is running you can close it if you like, the next time the word PROG seen in the RX panel, FLAMP will execute.

The downside of side of this is you can receive a complete 100% confirmed file without every seeing the PROG Event, It's far better to manually execute FLAMP after FLDIGI.

Robert

From: Paul Adams
Topic: 5960 Message: 5960

Hi,

I'm sorry to bother you with this. I'm currently in Spain due to some urgent matters to help my ill cousin (Jane), she was diagnosed with a uterine fibroid and she needs Hysterectomy Surgery operation to save her life. The news of her illness arrived to me as an emergency and she needs family supports to keep her alive.

The hospital management is demanding for $5,000 before they can carry out the surgery operation to save her life, but I have just $2,400 with me. I need a loan from you and I'll surely pay back as soon as I get back home, If you can not raise all the money I'll appreciate whatever amount you can come up with. Please, let me know if you can be of help so that I can advise on how to transfer the funds.

Anticipating your reply to my request.

Best regards,

Gary

Hi,

Links to files on yahoo have a session component. They will work for you but they generally don't work when posted or emailed. This is nothing new. It's not due to the new interface. Yahoo doesn't want to be a file download repository I imagine.

So post a link to the file directory or folder and copy/paste the file name. Or use an alternate file service.

Hello all,

Please feel free to widely distribute this announcement:

####

Please send this to all groups and ACS Volunteers:

The Pennsylvania Emergency Management Agency Auxiliary Communications Service will be activated on Thursday October 17th, 2013 at 10:17 a.m. ET for the Great Northeast Shakeout as part of a nationwide earthquake exercise. KB3NIA will be the NCS and those duties will be delegated to K3EOC (Allegheny County). Digital net will be delegated to KB3FXI. The Digital net will run the entire length of the drill.

Starting at 10:17 EST Phone net check-ins will be held on the 75 meter band on 3.9935 MHz LSB
Starting at 11:17 EST Phone net check-ins will be held on 40m frequency of 7.272 MHz LSB.
Starting at 12;17 EST VHF/UHF phone net check-ins will be according to local area NCS protocols

Digital NBEMS net operations will be conducted on 7.0725 MHz USB using mode Olivia 8/500 centered at 1500 Hz waterfall frequency with a backup frequency of 3.5830 MHz USB. NBEMS nets will consist of plain text and ICS-213 message format using the FLMSG application. Larger plain text and CSV spreadsheet files will be sent with mode MFSK-32 and the FLAMP application.

NBEMS applications are available for free download at http://www.w1hkj.com/download.html. Those with questions or who need help with NBEMS/FLDIGI/FLMSG/FLAMP setup and testing may contact the PEMA/ACS digital manager at kb3fxi@....

The PEMA/ACS Great Shakeout nets will be directed nets. All stations are welcome to participate, but please follow the direction of the NCS.

Email not displaying correctly? View it in your browser.
Dear David,
NorthEast ShakeOut Update:
174,000 participants
as of today

Past participants: Please confirm that you are registered for 2013. (Receiving this email does not mean you are registered this year.)

ShakeOut Tip: Complete our event form to be listed on the ShakeOut calendar
The 2013 Great NorthEast ShakeOut on October 17 is next week! Registration continues to increase, thanks to participants like you who are spreading the word. More than 22 million people are now registered worldwide for 2013.

Be sure to review the How to Participate and Resources sections of the website for drill manuals and instructions for various situations.

Earthquake Safety is in Your Hands
A great extra step for after your "Drop, Cover, and Hold On" drill is to practice how you will communicate after a damaging earthquake. Learn how to "Text First. Talk Second."from ShakeOut partner Safe America Foundation, including how to hold a texting drill.

Your mobile phone can also help you get ready for an earthquake and respond quickly afterward. With the American Red Cross Earthquake Appyou can receive alerts and notifications when an earthquake occurs, prepare your family and home, find help, and let others know you are safe.

Finally, be sure to use your phone (or another camera) to take pictures and videos of your ShakeOut drill. Then share these via social media (use #shakeout). Also visitwww.shakeout.org/northeast/share to upload photos, share links to videos you've posted online, and write a description of your drill. We will highlight great examples in our email updates to ShakeOut participants next year.

The Seven Steps to Earthquake Safety

ShakeOut update emails this year have been highlighting each of the Seven Steps to Earthquake Safety, recommendations for what to do before, during, and after earthquakes. Following these steps is an optional aspect of your ShakeOut participation that may improve your preparedness for an earthquake or another emergency. If you have registered recently, please review previous emails that you may have missed.

Step 5: Drop, Cover and Hold On

When the earth shakes: DROP, COVER, and HOLD ON! The farther you move while the ground is shaking, the more likely you are to be hurt.

In most situations:
* DROP down onto your hands and knees (before the earthquake knocks you down). This position protects you from falling but allows you to still move if necessary.
* COVER your head and neck (and your entire body if possible) under a sturdy table or desk. If there is no shelter nearby, ONLY then should you get down near an interior wall (or next to low-lying furniture that won't fall on you), and cover your head and neck with your arms and hands.
* HOLD ON to your shelter (or to your head and neck) until the shaking stops. Be prepared to move with your shelter if the shaking shifts it around.If you are in bed: stay in bed, and cover your head with a pillow. People get injured when they get up and move around.

If you are outside: first drop then crawl towards open space if you can – stay away from building exteriors, overhead power lines and trees.

If you are near the shore: if you feel a strong or long lasting earthquake, or the water suddenly draws back from the beach, tsunami waves may arrive within minutes. As soon as it is safe to move, go immediately to higher ground or inland away from the coast.

Additional Situations and Resources:

* Recommended Earthquake Safety Actions (including situations when you cannot get beneath a table) (PDF | RTF)
* Key Earthquake Safety Tips for People with Disabilities and Other Access or Functional Needs (PDF | RTF)

* Recommended Earthquake Safety Actions For Parents and Care Providers of Young Children and Infants (PDF)

* Earthquake Safety in Stores (PDF)

* Drop, Cover, and Hold On: Doing it Right (See two families learn how to to be safe in their homes, courtesy of Totally Unprepared)

* When the Ground Shakes, Don't Panic: Drop, Cover, and Hold On. Your Kids Will Thank You (courtesy of Totally Unprepared)
For more about how to be safe during earthquakes, go to EarthquakeCountry.org/step5.

Who will ShakeOut with You?
Everyone, everywhere, should know how to protect themselves in an earthquake. Even if earthquakes are rare where you live, they may happen where you or your family travel, or perhaps where you or your children may live one day.Sobe sure to invite your friends, family, and colleagues to participate in this year's ShakeOut. A one minute Drop, Cover, and Hold On earthquake drill may one day minimizeinjuries or save their life. Spread the word at family gatherings, community events, and work meetings, and online via social media. You can also place one of the ShakeOut web banners on your organization's website, distribute flyers, and use other materials available on the ShakeOut Resourcespage.

Thank you for your participation in this historic event and for your commitment to disaster preparedness!

5974. RE: Great Shakeout - Oct 17, 2013, 10:17am ET

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-10-10 20:51:07 UTC
From: <dave.kleber@...>
Topic: 5972 Message: 5974

Here is some additional operational information for the Oct 17 Great Northeast Shakeout and the PEMA/ACS net that will be activated for the exercise:

Additional notes on the Great Northeast Shakeout exercise:

1) All messages and bulletins with simulated emergency traffic should start and end with: "this is a test message for the purpose of an emergency communications exercise... this is only a drill"

2) Our goal with the PEMA/ACS Digital net is to send and receive test priority and test emergency traffic and identify as many active on the air EOC and Served Agency Stations as possible. When possible, please use the ICS-213 form in FLMSG.

3) EOC manned stations (State, County and Local) as well as EOC and NET liaison stations are highly encouraged to participate. If you don't have access to your EOC station, but you have a working relationship with your EMA officials, ask them if they would be willing to generate an ICS-213 message that you could input into FLMSG to relay out on their behalf. Make sure your served agency officials understand that these will not be secure communications.

4) All properly licensed stations are welcome to participate. Please follow the direction of NCS. Depending on the amount of traffic, NCS may limit check ins to only stations with Test Priority or Test Emergency traffic. When time permits, NCS will take general check ins from any stations, anywhere.

5) Please do not acknowledge 100% confirmation or transmit resend requests unless NCS directs you to do so.

6) Stations need not be within Pennsylvania to participate, nor do they have to be affiliated with any particular services or served agencies.

7) WL2K / Winmor - We will be attempting to work with Winmor / WL2K during the exercise and hope to send at least 2 emails out to some of our PEMA officials. We will also be checking the Winmor address KB3FXI@Winlink.org. Please limit emails to this address during the exercise to messages originated by EOC/EMA officials and keep the content as short as possible. Again, be sure to advise your EOC/EMA officials that these communications are not secure but will be delivered with 100% accuracy confirmed, when possible, conditions permitting.

General information on the Great Northeast Shakeout is available at:
http://shakeout.org/northeast/

Hello all,

Thanks to all who checked in or monitored the PEMA/ACS NBEMS net in support of the Great NE Shakeout Earthquake Exercise.

We had 24 stations check in, 6 of which were operating from PA County EOC's.

Our apologies to the folks who were standing by for general check ins. The EOC check ins and traffic volume was to the level that we had to limit check ins to those from EOC's and stations with traffic only.

We have already received some very favorable comments from participants and observers.

Please feel free to post your feedback on the exercise here on the paNBEMS yahoo group so we can share our ideas on how to improve the NBEMS net process.

I thought this was very interesting using digital and a wonder to me.
Were you taking digital check ins? I wondered did they use a General message form and how did you line them up to send in order? The logistics is a wonder. Good job

Greetings, Tom.

Having no idea what to expect in terms of participation, we just pretty much played NBEMS NCS by ear.

I would have expected us to have the time to take general check ins but the level of participation was just too high, so we pretty quickly limited check ins to stations with priority or emergency test traffic and EOC stations.

With the great turnout we had, I'm hoping at least some of the folks checking out NBEMS for the first time will join us on the paNBEMS traning nets which we've been doing weekly since about 2005. The ultimate goal would be for us to have between 6 and 9 trained NCS's so that we could run a separate net, in the same bandpass, for general check ins with the primary net for EOC check ins and for those with priority or emergency traffic.

We had a lot of fun and learned a lot yesterday in the Great NE Shakeout and I'm already looking forward to our next chance to use NBEMS in a major regional or statewide exercise.

Dave,

Good copy in Kansas City, until ~11:00 ET. Then signals seemed to weaken and fade away. I could tell the net was quite busy, that's why I only checked into your pre-net earlier.

Had 100% decode on the ICS-205 and first 213 sent. We most surely could transfer information in the earlier hours of the morning. I was QRP & battery powered.

5981. Flmsg Template saving and loading

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-10-18 22:28:26 UTC
From: <tom_pryts@...>
Topic: 5981 Message: 5981

Selecting a Form and then filling out what will not change is a great way to save a template. Getting ready for Mercer County Pandemic Committee POD Exercise I wanted to Plan ahead with a Comm Log ICS 309 template to be able to start logging messages from the start with all the titles already filled in. But when I tried to reopen the ICS-309T it told me that this was NOT a Flmsg data file.
Yes the data was still there but after a few tries I discovered that my other Templates would not open giving the same error.
Removing the 309T I was able to open the other again.
Re doing my 309T caused the problem again.
Has any one else see this behavior?
I think its an extension problem but can not be sure.

Wish us luck as Saturday Oct 19 we support 3 POD centers doing 2300 Flu shots all connected to the EOC with PA NBEMS and digital Comm ARES/RACES

That's great news.
Will continue to save to the message folder and use save as. That's our work around for this problem.
Create a Message template as we call it. Don't save under Template but under file.
Call it up. Fill it out and then save it with a changed name using save as.

Will up date ACS group here.

Subject: [NBEMSham] flmsg-1.1.33 posted

http://www.w1hkj.com/

Includes the following changes since 1.1.32

Version 1.1.33 - Maintenance release

ICS309 template
* Bug fix - missing header in template file

UTF-8
* Changed charset for all html templates to UTF-8

MXE build
* mods to allow compilation in mxe-mingw32

Topic: 5981 Message: 5987

Saturday Oct.19,2013
The update to Flmsg to 1.1.33 came to the rescue.
highlights of an outstanding day using paNBEMS in support of the
Mercer county pandemic committee POD exercise.

ICS forms used: 309, 213, 214, 205
8 operators: County EOC and 3 POD sites. They were Hermitage, Grove City and Greenville.

The County EOC 53 digital messages
A friends computer and radio running unattended collected 68 flmsg messages.
operated from 0800L to 1300L time.

A total of 1164 Free flu shots were administered during this drill.

Subject: [paNBEMS] Flmsg Template saving and loading

Selecting a Form and then filling out what will not change is a great way to save a template. Getting ready for Mercer County Pandemic Committee POD Exercise I wanted to Plan ahead with a Comm Log ICS 309 template to be able to start logging messages from the start with all the titles already filled in. But when I tried to reopen the ICS-309T it told me that this was NOT a Flmsg data file.

Yes the data was still there but after a few tries I discovered that my other Templates would not open giving the same error.
Removing the 309T I was able to open the other again.
Re doing my 309T caused the problem again.
Has any one else see this behavior?
I think its an extension problem but can not be sure.

Wish us luck as Saturday Oct 19 we support 3 POD centers doing 2300 Flu shots all connected to the EOC with PA NBEMS and digital Comm ARES/RACES

5988. UN compressing Flmsg forms

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-10-25 02:41:02 UTC
From: <tom_pryts@...>
Topic: 5988 Message: 5988

Today I received a comp base64 MT63-2kl of a ICS-213 form

it looks like a block of text on my receive window and Flmsg did nothing with it.
How do I un compress it to make it readable in my ICS- 213 form?

Thanks

Tom

5989. Great Northeast Shakeout PEMA/ACS NBEMS 40m Net Report

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-10-26 03:20:39 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 5989 Message: 5989

Great Northeast Shakeout exercise - Oct 17, 2013
PEMA/ACS NBEMS 40m Net Control Station Report

NBEMS 40m operations were all conducted on 7.0725 USB with the primary mode of Olivia 8/500 centered at 1500 Hz bandpass/waterfall.

The primary goal as Net Control Station (NCS) was to:
1) Facilitate the delivery of Priority and Emergency test traffic.
2) Take check ins from EOC/EMA and other stations working with served agencies.
3) Take general check ins from any stations.

With the anticipated participation of several new operators with NBEMS, we started pre-net tests where as NCS I did a message broadcast announcement of the drill at 8:35am ET followed by the ICS-205 for the exercise at 0840.

Prior to the official start of the exercise, we had several stations confirm receiving the ICS-205 and several additional stations checked in.

At the 1017 start of the net we transmitted a general bulletin announcing the net including some general procedures, followed by a call for check ins from EOC stations and stations with traffic.

The start of the net mostly consisted of EOC stations and stations with traffic after which we followed with a call for general check ins. It quickly became apparent that we were going to have more general check in stations than we could handle so I attempted to limit check ins to only stations with priority or emergency test traffic, but in spite of the direction of NCS, we continued to get general check ins without traffic.

We logged a total of 28 check ins, 8 formal messages, 1 CSV medical data spread sheet and of the 28 check ins, 6 were County EOC stations as well as the Western Region PEMA office.

Thanks to all who participated and monitored the net.

Just before the PA NBEMS net at 1330Z is VOA Radiogram at 1300-1330Z on 6095 kHz. Use AM, LSB, or USB mode to receive and decode.

Today VOA Radiogram will experiment with the new MFSK64L and MFSK128L modes. These require Fldigi 3.21.76AR.

Hi Kim,

The signal on 6095 kHz was very good this morning in the Philadelphia area. I had a problems with the MFSK64L and the MFSK128L modes. I had the AFC control active and it seems like it couldn't get a fix on the signal. Finally about 1/2 way through the transmission it settled down and copied the text. Next time I will turn off the AFC control.

5992. How do I responde to a Flmsg

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-10-30 11:31:36 UTC
From: larry_kb8emd
Topic: 5992 Message: 5992

I'm very new at NBEMS and how to pass messages.
I belong to a group that is just getting started we all are trying
to work our way through the in's and out's of sending forms using
FLdigi and FLmsg.

Last night using our net on 2-meters we passed several ICS-213
messages where net control would send a message and we would respond
by filling out the form and sending it back.
with few glitches it went well, we used MT-63-2KL.

I need to know how do you send Olivia OL 8/500 using the ICS-213 form
with "autosend" when the included modes on the form doesn't list OL 8/500 as a choice?

I am a little confused by your e-mail. When using FLmsg, you don't select the mode within it. When using FLamp, you may select the mode within it. If Olivia 8/250 is not on the list within FLamp, no problem. First, go to the configure tab and check the second of the two tabs. If you do this, FLamp will send the traffic in whatever mode you have selected on FLdigi.

Dave the confusion it's all on my side
but if the list of modes on FLmsg isn't to select the mode of transmission what are they there for?

just as a reminder to the responder what mode was used to send the form?

if so then I wonder why all modes are not listed.

After posting I did a trial filled out a form changed FLdigi to Olivia OL 8/500
and it sent the form in OL 8/500 since I wasn't hooked to a radio it only printed to my screen.

Like I said I'm old in life but new to digital
I will have to read up on FLamp which I have not used.

thanks for your help I do enjoy reading about the activates

Larry I think I can explain. First make sure all the FLdigi and FLmsg programs are closed. Open FLdigi and let it completely start, then open FLmsg. The list of modes will now be linked, changing in one program changes the other. I confirmed prior to replying on my install. Following this will list all modes in FLmsg.
Software versions
fldigi 3.21.77
flmsg 1.1.32

By the way FLamp is a great addition for getting 100% confirmation to multiple stations, and allows timed tx cycles with U/VHF FM to give transmitters a break or prevent timeouts. Tweak the settings for conditions and allow priority break-ins on HF during larger transmission

If you need live help I can setup remote connection and guide you.

From: <dave.kleber@...>
Topic: 5998 Message: 5998

Hello all,

Are there any hams out there interested in trying to move WL2K traffic to and from NBEMS HF digital nets? How about some stations who could help moving meaningful data and messages to and from your local nets (phone or digital) and the NBEMS HF digital nets.

I'm getting more involved in Winmor but as NCS on NBEMS nets and exercises such as the 2013 Great Northeast Shakeout, our primary NCS need some liaison stations to help move data to and from WL2K and the NBEMS nets. Also, having liaison stations from specific counties or local nets can help consolidate message handling and reduce check ins on the digital HF nets.

Please let me know if you know anyone who would like to coordinate some testing.

Subject: Monitoring Potential Storm Setup for Next Week...

Keeping an eye on the potential for a winter storm to affect the Northeastern U.S. toward the middle of next week. Right now it's way too early to start speculating on which areas might get hit and what the impacts would be. But it is something worth keeping an eye on.

More details as we move closer. It could end up being nothing for our region, so don't sound the alarms yet.

Subject: [SATERNSouth] Frequencies for Philipine HERO operations

The Philippine Amateur Radio Association is currently conducting Ham Emergency Radio Operations (HERO) at the following frequencies:
* 40 meters HF - 7.095 MHz (Also, possibly 14.277 and 14.285 MHz for H&W)
* 2 meters VHF - 144.740 MHz Current Net control stations:
* Jojo, DU1VHY
* Thelma, DU1IVT
* Romy, DV1SMQ
* Max, 4F1BYN HERO Operators in the disaster area:
Tacloban:
* Nathan, DU5AOK - HF/VHF
* Vilma, DU5VIE - HF/VHF
* RADNET, DX5RAN - VHF
* ACCESS 5, DX5LYM - HF/VHF
* Lester, DV5PO - HF Borongan, Eastern Samar Bohol:
* CHARL, DX7BC - HF
* Ador, DU7AL
* Gerry, DU7AU Cebu:
* Cebuano Amateur Radio League, DX7CA - HF/VHF Dumaguete:
* NORAD-7, DX7NRD - HF/VHF Iloilo:
* Bobby, DU6BG - HF Roxas:
* Arnel, DV6WAV - HF
* Iver, DV6ILA - HF
Thanks to George Hiscox, WA6RIK for this information.

We provide this info so that you can have advance information when operating. Please give these frequencies a wide birth so they can carry out needed emergency communications. If conditions exist where you can help, monitor the HF frequencies listed.

Be alert for more information from The Southern Territory EDS. The weekly update is coming soon. Look for it here.

6003. FLDIGI uninstall/install

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-11-17 15:28:19 UTC
From: <k3vyy@...>
Topic: 6003 Message: 6003

I was going to uninstall fldigi (.75) and install .77 this morning. Running Windows 8.1. When I went to uninstall, NORTON immediately flashed up a message that it found SUSPICIOUS.CLOUD.9 and removed it, and Windows would not allow me to uninstall the program.

I finally went in and erased the program files manually, and ran Norton Power Erase.

When I tried to Install FLDIGI .77, same thing happens. Norton catches the virus, and the program ends up being installed.

I know I will get some comments about Norton antivirus, but I think it works well. Have never gotten the RED warning before,

Anyone else had trouble with the installer on FLDIGI??

I'm new at this digital stuff (3-months) I join a couple weekly and one monthly net.
they are primarily training nets helping get newbies like my self set up their rigs and interfaces.
we haven't tried to send pictures if I were to try and send a picture how would I go about doing that?
what form to use if any and what modes works best?
this will be used on VHF/UHF
Thanks

You can send tiny pictures in the Mode MFSK via Fldigi or Multipsk. You can send detailed and moderately large pictures via SSTV using various sub modes of SSTV. SSTV is supported vi Multipsk, MixW, DM780 , MMSSTV, and others. You can send digital images also via Easypal. Easypal has some good additional techniques for sharing images with a net, similar to FLAMP.

Hello all,

I will be active on 3.583 USB, 1500 Hz Center Waterfall, Olivia 8/500 tonight from 9pm ET on through the night.

All are encourged to check in and chat.

If PEMA Auxiliary Communications Service is activated, we will shift from informal check ins to directed net mode. As always, when in directed net mode, please closely follow the direction of NCS.

Also, feel free to jump on 7.0725 USB today. I am at work but left my station to monitor the 40m spot.

Hope all is good David, I know MN is expected some snow starting tonight and through to Thanksgiving.. Teresa and her sister are heading to Duluth to do some shopping and head down that way on Monday leaving for Nevada.

Got good new snow tires on the trucks so all set.I wish the snow would come and insulate the septic fields before temperatures really drop..

Hello all,

N3LRR, Bill Edgar, ARRL Atlantic Division Director, has set up a forum at the following web address:
http://www.bfdinforums.com/

Bill is a really good guy that has made major contributions to improve communications and training in ARRL/ARES by providing webinars and this new forum, which he does at his own expense.

I've been fairly active on the ARRL forum and asked if a digital section could be added, and Bill did just that.

The forum is open to all. Please check the site and consider helping by posting some messages.

Same thing goes for here on paNBEMS. We want to hear more about your local and regional NBEMS activities. I'm seeing new nets pop up pretty regularly... I saw a NC net the other night and what looks like a new NH net, both on HF. I've also heard of some increased NBEMS activities in FL.

Let us know if you have questions, need help or just share some of your experiences with NBEMS and what works best in your area.

Thank you for allowing me to join the paNBEM group. My name is Rez Johnson, K1REZ. I'm the District Emergency Coordinator for the nine counties located in East Central Mississippi (State Highway Patrol District 6).

I've been using FlDigi off and on for the last couple of years for making casual PSK31 contacts. However, I was very interested to hear about NBEMS and am looking forward to learning more about how I can implement it in my district.

I only have one question at this point and it has to do with FlDigi.

I use to be able to send current weather information on FLDigi. However, it is no longer working properly.

It now sends the exact same (incorrect) weather data, regardless of which METAR station I specify.

I keep checking under the WX tab and everything is correctly entered and checked. I am supposing that I made some changes to other setting which affect the WX setting, but have not yet figured it out. I am considering using the "Restore Defaults", but hoping not to have to.

Any advice?

Thanks,
Rez, K1REZ

Welcome aboard, Rez.

Try right clicking on your WX macro tag and manually changing the METAR code.

I just had to do the same thing the other night.

6014. FLMSG and FLAMP

Yahoo group: paNBEMS (2012 — 2018)
Date: 2013-12-17 21:37:15 UTC
From: David Kleber
Topic: 6014 Message: 6014

Hello all,

We have a lot of new folks on the list here so I thought I would make some observations on some of the best use case scenarios for both FLMSG and FLAMP.

The FLMSG application is best suited for sending shorter messages such as the built in form-based messages or small text files. The application "wraps" the message with a checksum calculation and also includes a miniumal amount of code for the message header and for the form formatting. The trasnmission method for FLAMP is a single uniterrupted transmission from which receiving stations can either confirm or deny 100% accurate receipt. If a receiving station gets a check sum error, the entire message has to be repeated.

FLAMP is quite different from FLMSG in that it is specifically designed for sending files. FLAMP breaks the file down into user defined check sum blocks. Some FLAMP files might only be a few blocks and larger files could be 30, 40 or many more. The receiving stations' FLAMP receives the file header info and the subsequent blocks. FLAMP shows the receiving station operator the progress of the received blocks and if all blocks are confirmed 100%, the receiving station can then either save, view, relay or email that file.

FLAMP has the advantage over FLMSG in the case where a larger message has only a few errors. With FLMSG, the entire message would have to be resent, whereas with FLMSG, the receiving station sends a report to the sending station listing only the blocks in the file that were missed. The sending station then sends only those missed blocks.

FLMSG is still our best bet for short text files and messages using the built in forms.

FLAMP is best for large files using fast modes to a few other intended receipients or for bulletin broadcasts of very short messages to many. In the short message bulletin broadcase scenario, the sending station would pick a slower, more robust mode such as MFSK-32 and would retransmit or repeat the same file transmission several times. This helps ensure that as many receiving stations as possible receive the file with all blocks and the file 100% confirmed.

There is one last use case scenario under which we are currently testing FLAMP. There is a VoIP link system called WAN (Wide Area Network - wanrepeater.net) which connects web-based ops and also links repeaters. The system uses the Allstar/Asterisk VoIP PBX system. While the system audio is very good on WAN, there can be minor VoIP glitches which are just enough to take out a few characters here and there when sending digital. These glitches can occur at different times on different linked nodes. Our MT63 2k long tests on WAN with FLMSG most often resulted in regular checksum errors. In most cases, the errors are limited to just a few characters. So, we decided to try FLAMP with the faster 5xPSK125R mode and had great success by repeating the message transmission either 2 or 3 times. The participating stations runnng FLAMP were able to confirm 100%

We're looking forward to doing more testing with FLAMP under all the scenarios I mentioned on both HF and VHF/UHF.

Please drop a reply or message to the list here detailing any experiences you have had with NBEMS. We're most interested in getting feedback on FLAMP testing and helping to answer any questions folks may have.

Hello all,

I don't consider myself anywhere close to being a doomsday prepper, but I think there are rare scenario's we should all take into consideration.

One of my concerns with radio emergency communications is an EMP, where all our unprotected solid state equipment gets fried. This could happen as a result of a solar event such as a repeat of 1859 or from a nuclear EMP.

I am considering storing my FT-817, an HT and my netbook computer in something that would protect from an EMP and I wonder if anyone has any suggestions.

Please post your ideas here on the list.

But you're probably looking for an active system setup that is caged. That
will cost a few thousand dollars. You would need a circuit breaking system
capable of reacting as fast as the EMP.

Wal*Mart sells a lot of Faraday cages everyday. A microwave oven isn't as cheap as a garbage can (unless you find one IN the garbage). If you remove the electronics and store them inside, you might have something to cook with afterwards, as well. Look for a simple one with no display and a mechanical turn-the-dial timer.

.ja.

From: <w4iwk@...>
Topic: 6017 Message: 6022

I've heard there are two simple tests for the effectiveness of a Faraday cage of the trash-can type. Put a cell phone and an AM radio in the cage and drive to a cell tower and then to an AM broadcast antenna site.

Call the cell phone. Tune the AM radio to the station. (Hams have other options with HT's etc. but I've heard that EMP is strongest at US AM broadcast frequencies.)

If you can hear the ringer &/or the AM station, the cage is of little or no value. If you can't hear either, it may provide some protection.

Any comments from the group as to the validity of these tests?

All very good suggestions! Consider using metal tape to seal gaps.

My approach has been to hold on to all my old tube gear. For instance I can still run RTTY with a Model 28. It may be of interest that one of the world's powers delayed converting to solid state military electronics for decades in favor of their tube gear just as part of a defense against EMP. Doomsday folks have published a number of articles on construction of Faraday Cages which, they claim, pass the cell phone and AM radio tests. If we ever suffer an EMP I will let you know if it worked here.

Good luck Dave!

Hello all,

I don't consider myself anywhere close to being a doomsday prepper, but I think there are rare scenario's we should all take into consideration.

One of my concerns with radio emergency communi cations is an EMP, where all our unprotected solid state equipment gets fried. This could happen as a result of a solar event such as a repeat of 1859 or from a nuclear EMP.

I am considering storing my FT-817, an HT and my netbook computer in something that would protect from an EMP and I wonder if anyone has any suggestions.

Please post your ideas here on the list.

Hi,

about microwave ovens as Faraday cages. I read the other day in QST that microwave ovens are typically shielded specifically for the frequency that their magnetrons emit. This implies that EMP waves may get through.

If you are looking for metal tape to shield arbitrary gaps, check out self adhesive copper tape such as that used in gardening to make a slug shield. The adhesive does not conduct but I've found that the tape lends itself very well to soldering. Overlap two pieces of tape and apply solder to the edge to make them appear as one piece.

That said I think EMP prepping is a bit useless. Either the entire US or a larger area is affected in which case I'm not sure what good it would do to be the only guy with a radio. If only your city/area is affected you could either order a new radio drive to buy one. Your faraday cage could be replaced by the replacement value of the radio sitting in a savings account or in your safe in cash. Of course it can be fun to prepare for such events regardless of how realistic or useful it really is.

I read recently that the U.S. military has done extensive testing on EMP effects and found that tube based electronics faired a little bit better than solid state electronics, but most tube radios still failed due to other components.

However, in spite of this, the solid state military PRC-77 VHF manpack 2-way radio survived extensive EMP testing.

OK on the PRC-77. Now the question should be "how does it survive EMP".
Regardless of the encryption and other high-end transmission methods, we
should look at the construction and component choices made to create it.

Some interesting info out of this thread.

I'm most interested in preserving just a few transcievers that I would keep in storage, primarily my FT-817.

Many years ago, I worked for Ritz Camera (back in the age of film), and we sold lead lined bags to store your film in to prevent damage from the airport X-Ray machines.

I wonder if there's any such product like that which would protect against EMP?

I don't recall all of this and the Faraday cage thread, but I don't recall much documentation being offered.

Have you reviewed the lightening and EMP articles published in QST periodically since 1986? See http://www.arrl.org/lightning-protection . One conclusion from the Part 3 article on EMP was "Most of the solid-state, and all of the tube-type, radios were not susceptible to the simulator field pulses until long, external wires were attached". I have not researched this recently, but I'd be interested in seeing up-to-date conclusions with respect to the significant advances in miniaturization of the modern radio's component parts (finer IC masks, narrower PCB trace spacings, and so forth).

TEMPEST was about more than just eavesdropping on computer screen. I suppose that protecting a handful of devices is not much different than protecting a roomful. Wikipedia might get you started on the topics of radiation hardening and TEMPEST. But you might consider just short-cutting the research process and getting US Army publication "Engineering and Design - Electromagnetic Pulse (EMP) and Tempest Protection for Facilities". A version from 1990 is available at http://www.fas.org/nuke/intro/nuke/emp/toc.htm . Chapter 8 provides an interesting comparison between lightening strike and EMP.

Happy New Year to All!

EMP is a very broad spectrum RF "signal". Remember the wavelength of the signals you are trying to keep out. The cell phone test (very crudely) will only work up to and around the frequency of cell phone signals. Also keep in mind that the signal is extremely weak compared to an EMP signal. There may only be attenuation of the signal, not complete shielding. If there are any openings in the shielding, that will open the shielding to signals having a wavelength equal to that length and shorter. The best and simplest way is to completely solder a shield shut so there are no openings of any size in the shielding.

This is a pretty complex subject and not easy to address in a short e-mail. I worked at an institution that had a physics research lab that was looking for very small signals. The detector was cooled to liquid nitrogen temperatures to get rid of thermal noise. The room itself was shielded (from ambient noise) to around -140 dB. It was an expensive project and utilized "chokes" on openings to bring dc power to the room. DC was used to reduce noise.

There is no way for civilians to test a shield with an EMP signal, so efficacy is just a hope. If I have time, I will try to post some good references.

Jarrett,

> However, I did the cell phone test and in 2 microwaves and the freezer
> it would still ring...so I'm not as confident in my EMP shielding as I
> was a few days ago.

I'd be less concerned about the cell-phone test and more concerned that the all the openings into the freezer are RF screened.

The US Army document I referenced a couple of days ago offers this bit of advice in Chapter 6, paragraph 6-5.b(2):

"Submarine analogy. In general, the inspector needs to know only that EMP is an electrical threat which is analogous to water around a submarine: the submarine is the facility and the water is the EMP threat. Conversely, the air in the submarine is the electromagnetic radiation. To keep EMP out and the EM radiation in, the inspector must ensure that all penetrations of the shield (hull) are sealed in some manner. This is done with EMP and TEMPEST filters in conductive lines, ... RFI-tight doors and hatches for personnel entry. It is not necessary to understand the physics which make these devices work--only that they are in place and RFI-tight at their joint with the shield by proper attachment (weld or gasket) Common sense is far more important that an in-depth knowledge of physics."

In other words, the analogy suggests that a first pass test is that if it will leak air, it will leak RF.

So, if that freezer were holding my kit, I'd want to have the power cord removed, the drain plug hole RF screened, attention given the handle/release/key to ensure adequate shielding, and the door seal RF screened. If the interior was seamed metal, I'd consider electrically bonding the joined panels; if the interior is not metal-walled, there are probably large RF passages thru the outer shell (the compressor compartment, underneath, etc). Keep in mind that RF screening requires bare metal to metal contact to conduct the electrical energy, otherwise you end up with some sort of wave-guide or slot antenna into your freezer compartment.

As I am not expert in these matters, I have so far tried the 'common sense' approach advocated in the analogy.

I look forward learning more of the physics and practical application of the techniques.

Hello all,

The PEMA EOC is in partial activation mode today through at least 8am ET tomorrow for the winter storm. PEMA/ACS has asked that we activate a PEMA/ACS NBEMS digital net tonight at 8pm on 3.583 USB.

A few PEMA/ACS stations may be monitoring 7.0725 USB today.

Feel free to jump on, put out a call, and give a weather report or relay any storm releated info from your area's local nets.

I should be home from work by about 9pm ET and will put out some calls on 3.583 USB along with any bulletins we might have at that time.

-Dave Kleber, KB3FXI
paNBEMS

6045. Net Activation - Sun Jan 5

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-01-05 17:50:13 UTC
From: David Kleber
Topic: 6045 Message: 6045

Hello all,

Pennsylvania Emergency Management Agenecy Auxiliary Communications Service (PEMA/ACS) has requested that we activate a paNBEMS PEMA/ACS Weather net, starting this evening (Sun Jan 5) at 8pm ET on 3.583 MHz USB. We hope to have NCS to monitor through the night.

Any stations are welcome to pick up NCS duties (including out of state stations). We don't expect high volumes of traffic but would like to have home stations acting as NCS monitoring and ready to receive traffic through the duration of the activation. NCS volunteers should also transmit an occasional call announcing the net activation and that we're available to take traffic, situation reports and weather reports. NCS should keep a log of the time, call and comments from stations checking in.

Here's a template for the NCS call that can be transmitted every 20 minutes or so.:

(your call) NCS paNBEMS PEMA/ACS Weather Net
Any stations with traffic or reports, please call (your call)
k

&

(your call) NCS paNBEMS PEMA/ACS Weather Net
Now taking check ins from any stations
please call (your call)
k

The State Emergency Operations Center (SEOC), KB3NIA, will be monitoring our net frequencies and may put out an occasional call to our NCS for traffic or to forward bulletins to the net.

paNBEMS PEMA/ACS operating frequencies for the activation are:
Sun 8pm ET - Mon 8am ET, 3.583 MHz USB, 1500 Hz Center Waterfall, mode Olivia 8/500
Mon 8am ET - Mon 6pm ET, 7.0725 MHz USB, 1500 Hz Center Waterfall, mode Olivia 8/500
Mon 6pm ET - Tue 8am ET, 3.583 MHz USB, 1500 Hz Center Waterfall, mode Olivia 8/500

I will start the net tonight at 8pm ET and run until approximately 2am ET Monday.

Please check in and let us know if you can take a shift as NCS sometime between Monday and Tuesday morning.

Also keep in mind that you can leave your stations to monitor when you are not home. Just make sure you have FLDIGI set with RxID (RSID detection) enabled as well as having FLAMP running.

Thanks!

-Dave, KB3FXI

From: Larry Trullinger
Topic: 6045 Message: 6047

Dave,

Thanks for posting Net info!

I'll be monitoring and if there is a message/file hope to Relay it into
a Kansas City ARES VHF digi net for reference. Using multiple instance
of Fldigi allows one to work both HF and VHF, simultaneous, of course it
also requires two sound card interface.

6048. Re: [paNBEMS] A question regarding flmsg

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-01-05 19:57:58 UTC
From: David Kleber
Topic: 6046 Message: 6048

Greetings, Rob.

Assuming you have the current versions of FLDIGI, FLMSG and FLAMP downloaded and installed from w1hkj.com, go to FLDIGI, Configure, Misc, then click on the NBEMS tab. You should see an option to locate FLMSG. Click that and navigate to your program files folder, then to the current FLMSG folder and click on the FLMSG file.

Make sure "Enable" NBEMS data file interface is checked and "open with FLMSG" is checked, then click save, then close.

Once this is done, when FLDIGI receives an FLMSG message, the message will pop up.

Let us know if that works.

Subject: [paNBEMS] A question regarding flmsg

Hi,
A new user here.
I have checked into the Sunday morning nets several times now. It seems a message sent via FLAMP is copied perfectly. But nothing happens when a message is via FLMSG. All looks good in the receive panel but nothing in FLMSG. I must be missing something.
Can someone point me in the right direction?
 I know I have a lot to learn, and do so every Sunday!

Thanks in advance for any help!

thanks Dave. I now have it set up as per your instructions above.
I had tried:
Configure
    Auto Start
        Program 1 (Path to flmsg.exe)
            enable
That would open the program OK but wouldn't copy the message.

Thanks for the help!

Rob

6050. Squelch and unattended monitoring

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-01-06 20:51:31 UTC
From: <conawayny@...>
Topic: 6050 Message: 6050

When monitoring and leaving the FLDIGI system unattended, I find that the squelch control turns itself off. I suspect this happens following or because a change of Mode.
i.e. monitor Olivia with squelch set appropriately - mode changes to MFSKxx for a message - mode changes back to Olivia but squelch seems to be off because I copy hours of driddle.

Has anybody else experienced this while it happens? Is there a fix?

Conversely when changing modes manually I sometimes find I have to readjust the squelch (downward) to enable decoding a message.

If you know that others have FLdigi running unattended, it would be well to send traffic as bulletins with FLamp or even FLmsg. If everyone did that, the squelch problem would go away. Once upon a time, I was a relay station for a regular qso between two stations that couldn't hear each other. Relaying with FLamp is quick and easy.

6056. Jan 5-8 paNBEMS PEMA/ACS NBEMS Activation - Summary Report

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-01-14 18:49:02 UTC
From: paNBEMS-owner@yahoogroups.com
Topic: 6056 Message: 6056

paNBEMS PEMA/ACS NBEMS net was activated Jan 5, 2014 at 1800L and ran until Wed Jan 8, 2014, 0800 Local time.

Daytime ops on 7.0725 USB, 1500 Hz Center Waterfall, Mode Olivia 8/500 through 1800L

1800L switch to 3.583 USB, 1500 Hz Center Waterfall, Mode Olivia 8/500

We had:
146 check ins from 56 individual stations
22 Pennsylvania Counties were represented
12 States were represented
1 Station from UK (Bourne England)

I attended a meeting with PEMA officials last night and presented ICS-309 copies. They mentioned that several PEMA officials at the State EOC were monitoring our net traffic and messages.

I will be producing an after action report that will include feedback and suggestions for improvement in future paNBEMS PEMA/ACS NBEMS activations.

I would like to encourage those who participated or monitored this last activation to email me your observations, comments and suggestions, which I will consider for inclusion in the report. My email address is kb3fxi at yahoo dot com.

Thanks to all the stations who checked in with weather observations and who monitored. Your participation is greatly appreciated.

-Dave Kleber, KB3FXI

Subject: [NBEMSham] VOA Radiogram, Jan 25-26, includes MFSK16 times 2

VOA Radiogram for the weekend of January 25-26 will include two simultaneous MFSK16 transmissions on the same shortwave broadcast channel.

Then the broadcast speeds up to MFSK64 (240 wpm) for two VOA News stories with images, plus an image of me shoveling snow.

Details about this weekend's VOA Radiogram:

voaradiogram.net/post/74380708549/voa-radiogram-25-26-jan-2014-includes-mfsk16-times-2

Here's the schedule. I'm sure you'll want to be awake for the new transmission at 0930 UTC, or 4:30 am EST. Tell your friends in Asia and the Pacific about this one:

VOA Radiogram transmission schedule
(all days and times UTC)
Sat 0930-1000 5745 kHz
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1930-2000 15670 kHz

All via the Edward R. Murrow transmitting station in North Carolina.

6064. Fw: PEMA ACS Activation

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-02-03 15:23:45 UTC
From: David Kleber
Topic: 6064 Message: 6064
Attachments: 2 described; binary payloads are missing from this source WARC

PEMA has activated the ACS Team Feb 3, 2014 until 8:00 pm this evening. If anyone is available to activate an informal paNBEMS PEMA/ACS WX net as NCS, please do so. I wouldn't expect high volumes of traffic. We just ask that you put out an occaisional call that paNBEMS PEMA/ACS net is active and we welcome check ins with our without traffic or reports.

Please keep a detailed log including time of call, station, comments and your operating period - preferably in the ICS-309 form which is in FLMSG.

Operating frequencies:
Daytime 7.0725 USB, 1500 Hz Waterfall Center, Mode Olivia 8/500
Eve (after 6pm ET) 3.583 USB, 1500 Hz Waterfall Center, Mode Olivia 8/500

Unofficially, PEMA may also request an activation between 8pm ET tomorrow (Tue Feb 4) through 8pm ET Wed.

Please send any logs to kb3fxi at yahoo dot com. You can also transmit your logs on our operating frequencies with FLMSG or FLAMP. My station is set to monitor 7.0725 USB during the day with RSID, FLMSG and FLAMP enabled.

Thanks,

-Dave Kleber, KB3FXI
PEMA/ACS Digital Manager

PEMA has activated the ACS Team Feb 4, 2014 from 8:00 pm ET this evening. Operational period should run through Wed Feb 5, 8:00pm ET.

paNBEMS PEMA/ACS WX net will be activated for the duration of the operational period.

We ask those who volunteer as NCS to please keep a detailed log including time of call, station, comments and your operating period - preferably in the ICS-309 form which is in FLMSG.

Operating frequencies:
Eve (after 6pm ET) 3.583 USB, 1500 Hz Waterfall Center, Mode Olivia 8/500
Daytime (after 8am ET) 7.0725 USB, 1500 Hz Waterfall Center, Mode Olivia 8/500

Please send any logs to kb3fxi at yahoo dot com. You can also transmit your logs on our operating frequencies with FLMSG or FLAMP. My station is set to monitor 7.0725 USB during the day with RSID, FLMSG and FLAMP enabled.

Thanks.

Subject: Re: [paNBEMS] Fw: PEMA ACS Activation

PEMA has activated the ACS Team Feb 4, 2014 from 8:00 pm ET this evening. Operational period should run through Wed Feb 5, 8:00pm ET.

paNBEMS PEMA/ACS WX net will be activated for the duration of the operational period.

We ask those who volunteer as NCS to please keep a detailed log including time of call, station, comments and your operating period - preferably in the ICS-309 form which is in FLMSG.

Operating frequencies:
Eve (after 6pm ET) 3.583 USB, 1500 Hz Waterfall Center, Mode Olivia 8/500
Daytime (after 8am ET) 7.0725 USB, 1500 Hz Waterfall Center, Mode Olivia 8/500

Please send any logs to kb3fxi at yahoo dot com. You can also transmit your logs on our operating frequencies with FLMSG or FLAMP. My station is set to monitor 7.0725 USB during the day with RSID, FLMSG and FLAMP enabled.

Thanks.

Subject: flmsg 1.1.33AO posted for testing

It's been 5 months since the release of flmsg version 1.1.33.  Much work
has been done on that application in the interim.  This alpha release
includes the following that were not in 1.1.33.  Many of these changes
should be published for general release.  Please take the time to
evaluate the various forms for which you might have an operational
need.  Note that new forms have been added to support Civil Air Patrol,
Weather incident reporting and that many errors have been corrected.  I
would like to release 1.1.34 on or before the 22nd of February,
depending on your responses.

73, Dave, W1HKJ

1.1.33AO additions:

CAP
    * Added Civil Air Patrol form CAPF105
    * Added Civil Air Patrol form CAPF110

MARS ineei report
    * Added 2 more INFO addresse's
    * Modified pick list browser format

xml_io bug fix
    * bug caused shut down sequence error on OS X

ICS 309 csv export
      * Added code to allow exporting the ics-309 form data
        to a comma separated value flat file.
      * Fixed incorrect field tests that cause a nag dialog
        when autosending an ics-309 data file

UTC date retrofit
    * Added code to support local/UTC date selection
      for all calendar widgets which rely on the flag progStatus.UTC

WX reports
    * Added Severe Weather report
    * Added Storm report
    * Corrected CRC computation
    * Corrected Calendar GMT / Local selection
    * Fixed OS X ComboBox bug
```

ICS-309 bug fix
    * Fixed bug in ics309 comm time entry

Thumb drive
    * Corrected folder usage on thumb drive installation

Mars Navy format
    * Updated to suppress INFO addressee line if no addees
    * Added leading line DE CALLSIGN ####, where #### is
      leading zero serial number.
    * Fix bug in addressee parsing

MFSK 64L, 128L
    * Added MFSK long interleave modes to modes combo.

From: wb0kgn@...
Topic: 6077 Message: 6077

In past letters, there were comments about the effects of compression on error rate. As I recall, the use of compression could increase the error rate. Could someone repeat the comments. I can't recall why this should be true.

IMO, compression should not affect the error rate, when you define the term as errors per thousand bits or something similar. However, when sending uncompressed text, a single bit error or short error burst results in text that can still be read, even though there may be errors in it. When compressed text is sent, a single error bit or burst probably results in totally unreadable text.

This is exactly the information I was looking for, thank you. It would seem that if conditions are not quite good enough for the mode you are using, it might be well to give up compression. I thought that I had heard this, and needed a refresher course.

Also, the length of the data before the checksum is received will determine
how much of the compressed data is lost. If you wait for the end of the
transmission, then all is lost when something takes out the bits. If the
data blocks were smaller, then only that block is lost. How we receover from
that is either through ACK/NAK (AX25 packet) or FEC (MT-63, Olivia, etc).

Hello all,

I got an unexpected day off work today so I thought I'd run an impromptu FLAMP test today on 20m, 14.0645 USB, 1500 Hz Center Waterfall.

The test FLAMP file will be sent at 2pm ET (1900 UTC).

Make sure you have FLAMP open and running with FLDIGI set to MFSK-32 and the RSID RxID enabled.

The transmission will be a short plain text file repeated 5 times and the total transmission time will be approximately 10 minutes. I will stand by after the FLAMP transmission for reports. Reports may also be posted on the paNBEMS Yahoo Group list or to kb3fxi@yahoo.com.

Mike,

Be sure you have the right cable for the interface to the computer sound card or signalink. The smaller mini DIN is for FM mode packet only....you need to be connected to the larger ....I believe it is 13 pin to use for SSB sound card modes. The CAT cable or radio command connection to your computer is more of a nice convenience than a necessity.....it adds to the complexity of getting things to work with your computer. i don't have 706 myself but have helped my brother with his.

Mike,

I should be off work tomorrow and Thursday.

If you'd like, we could set a schedule for testing. I can hit any of the PGH area repeaters to talk you through settings and then we could test on HF.

Subject: [paNBEMS] Where to start

I finally had some free time to install FLDigi. I am completely lost as to how to configure it. Is there a how to or better yet a ELMER who I can get assistance from?

My radio is a Icom706MKIIG with a computer interface that used the accessory port. Computer is windows 7 64 bit.

Thanks
Mike – N3BSQ

Mike,

Be sure you have the right cable for the interface to the computer sound card or signalink. The smaller mini DIN is for FM mode packet only....you need to be connected to the larger ....I believe it is 13 pin to use for SSB sound card modes. The CAT cable or radio command connection to your computer is more of a nice convenience than a necessity.....it adds to the complexity of getting things to work with your computer. i don't have 706 myself but have helped my brother with his.

Hello all,

January was a busy month for paNBEMS with several PEMA/ACS weather emergency activations and a very productive meeting I attended on Jan 13th at the PEMA Western Region Office.

It's important for you all to know that your participation in these activations is greatly appreciated by the Pennsylvania Emergency Management Agency.

Thanks for your help!

Skip,
I also use Win7 but I use a cheap and reliable USB to serial adaptor that I bought from Mouser. I added a male DE-9 connector to the wire ends so it looks exactly like RS-232 out of a computer. I think it was only about $25 and the part number is:
USB-RS232-WE-1800-BT-0.0. It uses the FTDI chip and has been used here at work and at home to talk to my transceiver for a few years now. At work, we have used a board that plugs into the PCMIA slot and provides only 1 serial port.

Mike,
Make sure you have the 13 pin connector....audio will not go through in any SSB digital mode on the 8 pin. The 8 pin is for FM packet only on the 706MkIIg

Correct the 13 pin that goes into the AUX port.

The question I do have is this.

I have the 706 with the at180 tuner

On back of the radio I have the aux going into the top of the AUX on the at180 tuner. I have my cable plugged in to the bottom aux port.

That should work correct?

From: <dave.kleber@...>
Topic: 6102 Message: 6102

Hello all,

I'll be monitoring 14.0645 USB, 1500 Hz Center Waterfall today. Feel free to put out a call using RSID (TxID). I'll be listening on 20m until about 6pm ET when I switch down to 3.583 USB.

Preferred modes:
Olivia 8/500
MFSK-32

If I see your call, I'll be sure to answer.

Perhaps if we get a few folks on board, we could play some relay with FLMSG and FLAMP.

There is a strong possibility that PEMA may activate the State Emergency Operations Center and possibly the PEMA Area Offices on March 2, 2014 for an impending winter storm event.

We will post any updates on paNBEMS Yahoo Group and on our net frequencies as soon as we get them. At this time, it looks like a paNBEMS PEMA/ACS weather net activation is likely.

Ok, Jeff... but TX has had some winter WX this year, too. Maybe you're cherry picking your forecasts.

I just got back from Rincon Puerto Rico last week and we were living the good life with low 80's during the day and low 73's at night. I was ruling the beach as the middle-aged body-surfer!

Subject: [digitalhamradio] VOA Radiogram, Mar 1-2, includes 4 speeds of Olivia

On VOA Radiogram, 1-2 March 2014, in addition to our usual MFSK32, we
will include transmissions in four flavors of the Olivia mode: Olivia
64-2000 (29 wpm), 32-2000 (48 wpm), 16-2000 (76 wpm), and 8-2000 (104
wpm). As these modes become faster, they become less robust in the face
of challenging reception conditions. How fast can we go before
gibberish starts to appear on your display?

More details about this weekend's program at...

6107. Mar 2 2014 - paNBEMS PEMA/ACS WX Net Activation

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-03-02 15:51:12 UTC
From: <dave.kleber@...>
Topic: 6107 Message: 6107

paNBEMS PEMA/ACS Special Weather Net will be activated at 8pm ET tonight, March 2, 2014 on 3.583 USB, 1500 Hz Center Waterfall, primary mode Olivia 8/500.

From previous feedback on the paNBEMS PEMA/ACS WX nets, PEMA seems most interested in major secondary road closures. PA State Police provide reports for major highways and Interstates but PEMA requests reports for other major and secondary roadway closures and conditions.

Unless requested by NCS, automated weather reports from NWS stations are not necessary unless, in the unlikely event, PEMA HQ experiences an Internet outage. Time permitting, NCS will call for first hand weather reports. Transition of participation type are of particular interest.

All are welcome to check in (including stations outside of PA).

paNBEMS nets are directed, so please wait for your call from the Net Control Station.

6108. fldigi 3.21.78 quirk

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-03-03 01:59:27 UTC
From: <kj4vth@...>
Topic: 6108 Message: 6108

Finally loaded the latest version 3.21.78 and it does agree with my Kenwood TS-590s. Noticed DATA mode feature turned off on all bands. If I tap the DATA button the rig beeps and the feature remains disabled. Checked all settings and they seem to be the same.

Know I can run digital modes any way but the filters are wide open in USB mode. Reverted to 3.21.77 and DATA mode works as expected so I'll stick with that.

6109. NBEMS Training

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-03-04 17:53:08 UTC
From: kelseygs
Topic: 5626 Message: 6109

All,

Here is a great opportunity for training if you are new to NBEMS. Please RSVP with your county Emergency Management Coordinator or the host county of the session you wish to attend so we know how many to expect. The first halve of the training will be an introduction to NBEMS with the second halve going over the new ACS equipment the North Central Region Task force received, finishing with a discussion of regional ACS and future training, workshops, and communication exercises. Please feel free to contact me with any questions at kelseygs@....

----- Forwarded Message -----

Two opportunities for initial training on the new North Central Task Force Fly Kits for standardized Emergency Communication.

0830, Saturday, March 8, 2014

Lycoming County EOC

542 County Farm Road

Montoursville, PA 17754

570-433-4461

1900, Tuesday, March 18, 2014

Tokishi Training Center

124 NYPUM Drive

Wellsboro, PA 16901

570-724-9110

Training topics covered:

NBEMS - Narrow Band Emergency Messaging System - digital methods and modes for transferring messages and documents

Fly Kit Components and their use

Plus general discussion on the topics of :

Regional ACS procedures and team concept

Additional Training and workshops

Regional Full Scale Communications Exercise

Please contact your county Emergency Management Coordinator or the host county of the session you wish to attend so we know how many to expect.

6110. Fw: [NBEMSham] flmsg-1.1.34 posted; MAJOR UPDATE

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-03-05 16:59:30 UTC
From: David Kleber
Topic: 6110 Message: 6110

This is a good time to update to the latest NBEMS versions at
http://w1hkj.com/download.html.

This FLMSG update contains several form corrections and bug fixes.

Big thanks to w1hkj for running with my suggestion by adding the export to CSV function on the ICS-309 logging form.

Subject: [NBEMSham] flmsg-1.1.34 posted; MAJOR UPDATE

http://www.w1hkj.com

Be sure to read the updated on-line help file. This is a major update
to flmsg

Version 1.1.34

HICS203
* Improved html view template
* Fixed control access bug on UI

Custom forms
* Added custom form types to CSV forms

CAP cosmetics
* Various cosmetic changes

Deprecate Fl_Choice
* Changed all instances of Fl_Choice to Fl_ListBox

Main menu
* Fixed the short conflict, File / Form

UI modification
* Changed all Fl_ComboBox usage to Fl_ListBox

ComboBox/ListBox
* add key stroke handler to popup
* down arrow opens the popup if the combo has
keyboard focus.

* up/down arrow keys move selection in popup
* enter key moves the popup selection to the
output widget
* escape key closes the popup
* enter ASCII key sequence to search for and select
corresponding entry in popup
* closing popup erases keyboard buffer
* added class Fl_ListBox
- based on Fl_ComboBox, but with an output label
in lieu of an Fl_Input widget
- appeance is similar to Fl_ComboBox, but label
never receives keyboard or mouse focus.

Force compression
* Added user configurable forced compression

License Declaration
* Updated all source licensing to satisfy distribution requirements.

Transfer time
* Ported flamp transfer time evaluator

CAP
* Added Civil Air Patrol form CAPF105
* Added Civil Air Patrol form CAPF110
* Added configuration items
- change_modem_with_autosend
- sync_modem_to_fldigi
* Reorganized Forms menu

MARS ineei report
* Added 2 more INFO addresse's
* Modified pick list browser format

xml_io bug fix
* bug caused shut down sequence error on OS X

ICS 309 csv export
* Added code to allow exporting the ics-309 form data
to a comma separated value flat file.
* Fixed incorrect field tests that cause a nag dialog
when autosending an ics-309 data file

UTC date retrofit
* Added code to support local/UTC date selection
for all calendar widgets which rely on the
flag progStatus.UTC

wx reports
* Added Severe Weather report
* Added Storm report
* Corrected CRC computation

* Corrected Calendar GMT / Local selection
* Fixed OS X ComboBox bug

ICS-309 bug fix
* Fixed bug in ics309 comm time entry

Thumb drive
* Corrected folder usage on thumb drive installation

Mars Navy format
* Updated to suppress INFO addressee line if no addees
* Added leading line DE CALLSIGN ####, where ##### is
leading zero serial number.
* Fix bug in addressee parsing

MFSK 64L, 128L
* Added MFSK long interleave modes to modes combo.

73, Dave, W1HKJ

Some more info on the latest FLMSG 1.1.34 release.

-Dave, KB3FXI

----- Forwarded Message -----
From: Larry Levesque
Sent: Thursday, March 6, 2014 7:17 AM
Subject: [NBEMSham] Re: [linuxham] flmsg-1.1.34 posted; MAJOR UPDATE

Well I have barely heard a whisper or response to this new release announcement.

I don't think the implications were clear; This new version is a
MAJOR step along the way of allowing you to make your own forms for flmsg.

Basically you:

* take a Word or html document
* add input field names
* convert it to html (in the case of the word doc)
* slightly modify the html document
* create a text version of the html file
* create an CSV file with input fields
* create a template file
* put the files in the appropriate flmsg folders

You then have a CSV template for flmsg that you use to enter in your
text from a form handed to you.
When you receive it and print it out, it looks exactly like the doc / html original.

All of this can be done in well under 2 hours by someone with very
basic knowledge of html editing.

Once completed you can zip up the documents in a zip file for
distribution to others in your ARES / other group.
Of course you could send that file via flwrap/flamp to them. Or you
could always email it - :(

Please read the updated help pages for basic instructions and feel
free to as here for more help.

Thanks to Dave and the development team for making this possible and
not stopping there.

The next step in the process is to have the same output version of
the html document used for inputting the form instead of using the
CSV template.
Work is under way right now on this.

If someone has a for that they would like to have converted, please send it to me and I will pick 3 to convert and then send back to you so you can see for yourself how useful this is.

6114. SATERN - WB5ALM Is Now “On-The-Air”

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-03-11 14:59:32 UTC
From: <dave.kleber@...>
Topic: 6114 Message: 6114

In a digital chat I had with Ken (AD5XJ) on 20m a few weeks back, he said they're now working on the remote setup for sending and receiving digital NBEMS with FLMSG message forms and FLAMP file transfers.

The Southern Territory SATERN digital net is on 14.065 USB OLIVIA 8/500 +1000 Saturdays, 12:00 pm - 1:00 pm Central Time

####

WB5ALM Is Now “On-The-Air” From The ALM Divisional EDS Center

Jackson, MS (05 March 2014) – The FCC approved WB5ALM (William Booth 5 Alabama Louisiana Mississippi) as the official call sign for the SATERN station for the Alabama-Louisiana-Mississippi (ALM) Division of The Salvation Army at the Divisional Emergency Disaster Services Center in Jackson, MS. The call sign was activated on 04 March 2014.

The call sign was first used to check in to the International SATERN Net on 14.265 MHz on Wednesday, 05 March 2014. The new call sign will be used by both the fixed statin at the Divisional EDS Center as well as for mobile operations from the SATERN Coordinator’s official vehicle and whenever the Territorial Communications Trailer is deployed.

The acquisition of the specialized call sign culminates the nearly year-long process of building the Division's new SATERN station at the ALM Divisional EDS Center. The new station is capable of being completely remote controlled via the internet. Territorial SATERN Net Manager Ken Standard, AD5XJ, says, "The goal is to allow for a select group of qualified, trained Net Control Operators to operate a state-of-the art SATERN station that is centrally located within the ALM Division and the Southern Territory from their home location anywhere in the Territory." Territorial SATERN Coordinator Bill Feist – WB8BZH, adds, "This new station will make it easier to recruit SATERN operators to operate the station during a disaster or emergency by reducing the need for them to be physically present at the EDS Center."

The SATERN station has been in development for nearly a year and is completely state-of-the-art. The equipment consists of a Kenwood TS-2000 powering an Alpha 9500 into a Force 12 Delta C-3E tri-band beam and separate dipoles on 75 and 40 meters with 11 element beams for VHF and UHF. The station also has a Hy-Gain AV-680 all-band vertical as a backup antenna. The station also has an ICOM ID-800H into a dual-band J-Pole vertical and an Alpha 2000 dummy load. The entire station, including the TS-2000, the Alpha 9500, the Yaesu G-1000DXA rotor and all band and antenna switching can all be controlled remotely via the internet.

Ken and the SATERN folks are well aware of the fact that both ends need internet for the remote ops.

The remote setup is a great option for them, especially prior to and in the onset of their deployments where it might be difficult for a key operator to make the trip to Jackson Mississippi to man the station.

I'm hoping to be able to get on the air with Ken for some testing once they have the NBEMS all set up on the remote.

Hello all, I'm on 14.0645 USB, 1500 Hz Center with RSID on. My station is in Pittsburgh, PA.

Jump on and put out a call if you have a chance. I'll be monitoring until about 5pm ET / 2100 UTC.
Recommended modes:
Olivia 8/500
MFSK-32
I'll try a FLAMP test transmission at 4pm ET in mode MFSK-32 with multiple repeats. Make sure you have FLAMP running and FLDIGI set to act on RSID (RxID enabled)

Ok, Roland. Thanks for being on the air yesterday.

20m can be pretty rough with schedules like this. It's a lot different than spinning the dial for a causal contact and cherry-picking the strongest signals on the band.

In the short contact we had, you were down a bit toward the end.

I did get an email report of 100% from a fellow in Florida who left his transceiver in monitor mode with FLDIGI and FLAMP running.

I'd like to do some more 20m schedules, but my station is really geared for NVIS on 80m and 40m. It would be cool if we could find some big gun stations who have towers and yagi's to do some FLAMP testing on schedules.

Bill. After having joined VOAs testing almost a year using all possible modes, it seems that MFSK gets BETTER picture quality than any normal SSTV, except EasyPal. But the DRM based Easypal had the downside that way too many transmissions, at least into Europe gave nothing. SOME was excellent, but many many was nothing. No free lunch.

This is a big update to FLMSG.

Now we can create our own custom forms with only the need for some basic HTML coding.

I'll be doing testing during the day tomorrow and Thursday (Wed/Thur March 25-26 2014) on 40m 7.0725 USB.

If anyone within 40m daytime NVIS range would like to help with testing, please jump on the spot and put out a call. I'll be on from about 9am - 5pm ET both days, in and out of the shack.

Subject: [NBEMSham] VOA Radiogram, Mar 29-30, includes four 100-wpm modes

During the weekend of March 29-30, VOA Radiogram will mark one year on the air with a "battle of the 100 word-per-minute modes."

The same VOA News story will be transmitted in PSKR125, MT63-1000L, Thor25x4, and MFSK32, all more-or-less 100 wpm.

Details:

6126. Fw: [NBEMSham] flmsg-2.0.0AA posted

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-03-27 18:36:27 UTC
From: David Kleber
Topic: 6126 Message: 6126

This updated FLMSG adresses a few bugs we found in paNBEMS testing yesterday.

I would expect a new maintenance release relatively soon.

I'm on 7.0725 USB today until about 5pm ET. If anyone would like to jump on for testing, please do.

Make sure you download the alpha and then go to FLDIGI, Configure, Misc, NBEMS and point to the new FLMSG.exe

It doesn't take very long with a major application upgrade to find a few missing pieces and "like to haves". If you a trying to create custom forms for flmsg then you probably want to download the alpha version 2.0.0AA

http://www.w1hkj.com/alpha/flmsg/

It provides two distinct improvements.

1. case independent contents of the custom html form during the file discovery processing
2. independent html form server for each instance of executing flmsg (up to a maximum of 50)
73, Dave, W1HKJ

W1HKJ moved his server either last night or this morning.

I can get into his site just fine but others are reporting the same as you. It can take a day or two for all the DNS servers on the internet to update with his new server address.

You don't use the Data Mode when you work FlDigi with a Kenwood TS 590...

You shut the processor off, cut the power back to about 30 watts, and use upper side band.

You do have to have the proper settings in your computer and your transceiver.
Maybe you could find an Elmer to help you.

6133. Fw: [NBEMSham] VOA Radiogram, April 5-6, includes images and a table

Interesting results on the 100wpm mode battle.

I had my money on MFSK-32. paNBEMS has pretty much replaced MT63 1k long with MFSK-32, which seems to do much better under weak conditions.

Sent: Friday, April 4, 2014 4:33 PM
Subject: [NBEMSham] VOA Radiogram, April 5-6, includes images and a table

View Source

VOA
Radiogram, April 5-6, 2014, will be all-MFSK32. It will include four
images and the VOA English transmission schedule as an Flmsg CSV table.

Details at...

http://voaradiogram.net/post/81671836096/voa-radiogram-5-6-april-2014-includes-the-voa-english

A
quick analysis of last weekend's "battle of the 100-wpm modes" resulted
in then following average of correct characters as reported by
listeners...

MFSK32   98%
MT63-1000L   90%
Thor25x4   86%
PSKR125   74%

The
MT63-1000L would have had an even better result if it had not been for
four occasions of no decode at all. In situations where any MT63-1000L text was received,
its performance was very close to that of MFSK32.MFSK32
does have the advantage of being about 20 words per minute faster than
MT63-1000L. Furthermore, MFSK32, unlike MT63-1000L, can be used for
images.

Hi Dave
I followed your instructions to enter the Survey form into the "Custom" for FLMSG. When looking at this form after putting into the Custom area of FLMSG all I get is a form that says: Form transfer file: ERROR

I looked at this form by clicking FORM, CUSTOM.

If I go directly to the survey form by clicking FILE, FOLDERS, CUSTOM then the file is there and works fine with Firefox.

What did I do wrong.

Fred,

I don't have any ALE protocols set up here.

I wonder if anyone else on the list can shed any light on the ALE test.

Perhaps a misconception on my part, but ALE seems to be best suited for dedicated non-shared frequencies.

Hello all,

I'll be at the Skyview Radio Society club station WX3SKY today updating their computers with the latest NBEMS releases.

I'll be on both 40m 7.0725 USB and 20m 14.0645 USB at 1500 Hz center waterfall frequency.

Jump on and put out a call. I'd like to do some FLAMP and FLMSG testing.

Sounds great Dave, I am very active with ALE on ham bands and CFARS-MARS Ale frequencies…

Send me offlist the frequencies you scan and times and we can see if I can connect with you.

I have PC-ALE properly programmed, so the software seems to work properly. I am not confident that I know
how to use it, and I have not made any connections with it yet. I intend to keep exploring it.

Hi Dave

I guess my path to PA not working to well. I do have it centered on 1500 waterfall.

It'll be lunch in 30 min. FLDIGI is running.

From: Dennis Neese
Topic: 6153 Message: 6153

Hello

I have been trying to use custom forms and nothing works.
Have always used the latest version of FLDIGI and FLMSG which is now 2.0.2aa.

The custom forms I am trying is from the FLMSG download site. Forms ICS-206.htm and ICS-208.htm.
These froms are in the CUSTOM file of FLMSG

These forms open fine using firefox but when I try using flmsg all I ever get is a message that says
FORM transfer file: ERROR.
Also the Select custom form list shows nothing

I can not find any help files that explain what to do.

Can anyone help me with this problem?

Denny KB3IUU

6157. FLMSG 2.0 Custom HTML Forms

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-04-16 15:16:47 UTC
From: <dave.kleber@...>
Topic: 6157 Message: 6157

NBEMS / FLMSG testing continues with custom forms.

Prior to FLMSG vs 2.0, forms had to be hard coded into FLMSG in C++ programming. VS 2.o introduced the capability of handling HTML coded forms which still requires some expertise with HTML coding but is much easier than C++ programming.

The FLMSG HTML custom forms give us the ability to create forms at the request of served agencies and we can also create forms for use in our NBEMS nets. I made my own simple paNBEMS net participant survey form with which we are testing.

Why are forms so important in emcomm? Forms let us guide participants to provide the specific information that the served agencies need. A perfect example is the SKYWARN reporting form from the NWS eSpotter site:
http://espotter.weather.gov/docs/create_report.php

You will notice that there is no provision in the form for reporting "the rain stopped and the sun came out" (the infamous SKYWARN "sunshine report").

The custom HTML forms have to be copied into the FLMSG, Files, Folders, Custom folder. The full HTML files can be sent over the air with NBEMS/FLAMP file transfer protocol, or they can be distributed by email or file storing resources such as Yahoo Groups or sites like BFDIN (if BFDIN can be configured to allow .html attachments).

The way FLMSG/HTML Custom files work is that all participants have the full html file saved in their custom folder of FLMSG. The sending station opens the custom file with FLMSG then clicks on edit form, which brings up the form in their default web browser. The sending station then enters the form data on the browser view, then clicks submit at the bottom of the form. This action automatically updates the data in FLMSG. From there, all you have to do is click "Auto Send" in FLMSG, and the data is transmitted.

What's really slick is, only the input data and some minimal code is imported into FLMSG for the data transfer, bypassing all the HTML coding. The receiving stations' FLMSG then reassembles the data so that it can be saved, viewed or printed in the HTML form view.

If you, your club or net group would like help with testing, please drop a reply here and I'll be glad to help. You can also email me at kb3fxi at yahoo dot com. Posting questions here is better, though, since we can all share in the Q&A.

NBEMS will most certainly be undergoing new updates and improvements. Regular revisions to the software and help files may seem like an inconvenience, but these changes are necessary to the improvements and additional features that the system offers. Be patient and check for updates prior to your on the air testing.

The downloads of FLDIGI, FLMSG and FLAMP are available at:
http://w1hkj.com/download.html

And for those who would like to go one step further as alpha testers, download at:
http://w1hkj.com/alpha/

(for the FLDIGI alphas, always use the 3.21 directory)

Jump on the air, have some fun and hone your digital emergency radio communications skills. Most served agencies want and need the capabilities that NBEMS provides. And the best thing with NBEMS is it is FREE, EASY, Cross Platform (Windows, MAC, Linux), works on HF and VHF/UHF (SSB, FM simplex and repeaters) and requires no expensive hardware. All you need is a transceiver and a computer.

http://blog.promednetwork.com/2014/...rve-communication-integrity-during-disasters/

Ralph Dutcher, ARES/RACES member from Monroe County, New York, mentions Monroe County's use of NBEMS/FLDIGI. We have several of their members who regularly check in on the paNBEMS HF nets.

There's some good discussion in the video... enjoy.

If it can run XP, and stream a youtube video no problem then your good. single core running at 1.5 Ghz or higher. 1 gig of ram or more. But you could live with 512 megs if all your going to run is XP and your comm software. if your running Win 7 dual core cpu with 2.8 ghz or faster and at least 1gig of ram.

I have an old dell laptop with 512megs of ram. running XP with a single core running at 1.7 Ghz. All i use it for is comm software in the field. fldigi and a couple others for my local ARES group.

I have bought a few recon computes from this outfit

www.directron.com quick service and I have used the HP laptop
for many demos and I use it everyday as a WIFI connection
to send E-mail in my living room.....

17 inch HP laptop with WIFI, soundcard, battery OS 2 gig memory $159.00

I guess you can buy new ones but I liked the size of this one......

It works well with FLdigi and the Signalink, or acoustic coupling...
I bought them to demo FLdigi in my programs I have them the second
Saturday of the month.....

Sent: Thursday, April 24, 2014 5:59 PM
Subject: [NY-NBEMS] VOA Radiogram, 26-27 April 2014

Hello friends,

For the weekend of 26-27 April, we will transmit only one mode at a time.

One of the VOA News stories, about the Ukraine-Russia cyberwar, is very interesting, but it is also long and would take more than 10 minutes in MFSK32. So it will be in the faster MFSK64L mode.

Everything else will be MFSK32 except for the surprise mode during the closing music.

Here is the lineup for VOA Radiogram, program 56, 26-27 April 2014:

1:33 MFSK32: Program preview
2:45 MFSK64L: Ukraine Russia cyberwar
9:30 MFSK32: Heat into electricity, with image
13:46 MFSK32: Electric cars at the NY auto show, with image
21:33 MFSK32: (Spanish) NASA spacesuits, with image
26:00 MFSK32: Closing announcements

Please send reception reports to radiogram@voanews.com

VOA Radiogram transmission schedule
(all days and times UTC):
Sat 0930-1000 5745 kHz
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1930-2000 15670 kHz
All via the Edward R. Murrow transmitting station in North Carolina.

Last weekend, the MFSK8 "bonus" mode centered on 1000 Hz was mostly successful except in the most challenging shortwave reception conditions.
See videos from program 55
<http://voaradiogram.net/post/83722777323/videos-of-voa-radiogram-19-20-april-2014>.

I'm now responding to your reports from last weekend. I look forward to hearing from you this weekend.

Jump on and check in if you have a chance.

This is a good net. It would be nice to see some more NBEMS net activity on 20m, especially if a few big-gun stations could pitch in for relay help.

Yes, Don... Same thing at my station.

20m nets of any kind are a real challenge... it's a lot different than spinning the dial and cherry picking the strongest stations for a quick contact or QSO.

The best 20m nets are the well established Maritime Mobile and Hurricane Watch nets. They have strength in numbers and utilize a lot of relay stations.

It would be cool to have a US NBEMS 20m net if we could get enough folks to participate. 3 or 4 big gun stations with power and yagis could have a lot of fun with the relay help. But there are very few big gun stations I've come across who are on NBEMS.

Just checked into the Satern net as an early check-n. Signals were good here in NEPA.

Can't stay for the main part of the net because of a QCWA mtg but I can make with 40 watts and a rotatable dipole.

Got a very nice welcome from the NCS too!

Regards,

W.T.

David/Group

For some unknown reason I'm unable to decode Olivia from the Satern net. I turned on DM780 and I copy Warren TX to Ken..

Don't know why. I have latest FLDIGI running

David/Group
excuse the cross post

I see I have an issue with reading OLVIA 8/500 using FLDIGI v81
FLDIGI V 77 works. I was able to copy last of Net on 20 m using V77.

Don,

Take a look under configure, modems, Olivia, and make sure that 8 bit extended characters is checked.

.77 is really old. You might want to do a clean sweep, uninstall all your versions and folders and start from scratch. You can copy the old NBEMS and FLDIGI.files folders to a new directory to save your old data.

In DM780 there are two settings which are called Tune Margin and Synch Depth. Synch depth affects how weak a signal you can print (and how long it takes you computer to print). FLdigi has the same settings....but by different names. configure>modes>Olivia find "Tune Margin" and "Integration Period". "Integration Period" in FLdigi does the same thing and "Synch Depth" in DM780. Dave in Minnesota wb0kgn ----- Original Message ----- From: "Don Poaps" To: paNBEMS@yahoogroups.com Sent: Saturday, April 26, 2014 11:52:15 AM Subject: Re: [paNBEMS] Fw: [SATERNSouth] AD5XJ - 20 Meter Digi Net 14.065 USB OLIVIA 8/500 +1000, 4/26/2014, 12:00 pm David/Group For some unknown reason I'm unable to decode Olivia from the Satern net. I did the text capture and audio capture of the net after I left for my QCWA meeting. I saw that Skip, K3CC, made it in as well.

Ken had a heck of a signal in NEPA. Catch you tomorrow morning on paNBEMS.

Regards,

W.T.

Hello all,

I'm on 14.0645 USB, 1500 Hz center waterfall with RSID enabled. I'll be on this 20m spot until about 4pm ET.

Jump on and put out a call if you have a chance. Best modes would probably be Olivia 8/500 or MFSK-32.

Don,

20m seems pretty bad today. Not much to copy on the PSK spot or on phone. I did hear a strong station in MN here in Pittsburgh.

Dave,

Strange band today. 5% copy your signal on the wire antenna but 80% copy
on my Antron A-99 (CB works 10-17m well) Apparently you signal is heard
significantly better vertical polarization...

If you can try MT63-500L mode vs the MFSK32 you are presently using.

Will do, Larry.

Right now (2:50 PM ET) I'm running a FLAMP of a file from NWS on their PDS (particularly dangerous situation) bulletin with MFSK-32.

I'll switch to MT63 500 long interleave for another test at 3pm ET and I'll do a 3x repeat with FLAMP.

Correction on my last.

I'll do 2x repeat with MT63 500L (18 minutes). 3x repeat would have put tx time close to 30 minutes.

Dave

The band is fading here, even background noise has decreased. Less than
50% copy on the first pass.

Ok, things are really picking up with the tornado warnings in MS.

I'll be going into monitor only mode so we keep the spot clear for the Southern Territory SATERN folks.

I might suggest we not put out any general CQ calls and monitor this spot for help with relays if needed.

Dave,

Thanks for trying, band died a bit more. I missed blocks 6, 9, 10, 13

Not bad considering I'm using a CB 11m antenna! Perhaps a 'real'
vertical would have made the difference. I know on 20m regular band
signals are definitely lower than the wire antenna.

Digital Net Volunteers

The severe weather that has crossed the Northern part of the Southern Territory and encroached on the Midwest and Northern Territories, has left a deadly path of destruction. Many areas are without power and some utilities this morning.

In an effort to support the many agencies involved, we will monitor the net frequency from 09:00 - 14:30 today.

The Weather Channel is reporting this morning that a new round of severe weather is likely as the day heats up across the South.

We will listen for all volunteers who wish to join us in this vigil. If there are H & W requests from your area, we will gladly forward those to the SA headquarters in Atlanta for processing.

If you send appropriate weather reports, be sure they are of severe and/or dangerous conditions (HAIL, DANGEROUS WIND OR LIGHTNING, AND TORNADO OBSERVATIONS) and not general conditions.

We may also need relief operators to listen for various periods of rest or while the NCS is checking in with other agencies or nets. We may also need liaison stations to the International SATERN Net or local or regional emergency nets as well.

See you on the net ... de AD5XJ Ken SATERN So. Terr. Net Mgr.

6196. Fw: [SATERNSouth] SATERN So. Terr. Digital Net will stand down today

Yahoo group: paNBEMS (2012 — 2018)

From: David Kleber
Topic: 6196 Message: 6196

Thanks to all the paNBEMS folks that pitched in on the SATERN 20m standby activation.

The great thing about the NBEMS nets is that regardless of where we are and what groups we support, we can all pitch in (and regularly do) to help support other nets and activations.

Subject: [SATERNSouth] SATERN So. Terr. Digital Net will stand down today

SATERN / NBEMS volunteers

For the last two days the SATERN So. Terr. Digital net has been monitoring the net frequency of 14.065 USB in support of relief and recovery efforts in the wake of the severe weather that moved across the Southern Territory the last two days. Today we will stand down to our more normal training mode.

For the last two days, a number of stations stepped up to aid in the monitoring on a very wide coverage area. Not all stations were on frequency all the time. But we do appreciate what time was spent in this effort. Among those who may be counted are:

    KB3FXI Dave
    W8KF   Clair
    KB0ENB Larry
    VA7DGP Don
    WB0KGN David
    N3NTF   Tom
    WA6RIK George assisting as NCS
    K3CC   Skip
    WA6TVD George
    VA7TSD Don
    WN3LIF   W.T.
    KB3ORS Brian

If I missed anyone I am truly sorry. It is not intentional. So many have stepped up and supported our efforts across the country and I am very thankful to each and every one for volunteering their time and effort.

A special thanks goes out to George, WA6RIK who assisted by acting as NCS while the Jackson remotely controlled station and my home QTH was off due to locally dangerous weather. George, thank you for taking the reins when needed.

While we did not pass any emergency or H & W traffic, it did give us an opportunity to put to practical use FLDIGI, FLMSG, and FLAMP. I have received quite a few confirmed reports of

100% error -free copy at locations across the U. S.

Thankfully, we were not called on to deliver tragic news. And, we did not interact with any served agency or Salvation Army Unit. Nonetheless, we will maintain our vigilance for those occasions when it may be necessary. Hurricane season is just around the corner and now is the time to check and re-check our preparedness against that day when we will indeed be needed.

God Bless All of you for your efforts.

6198. Military/Amateur Radio Crossband Test - May 10 2014

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-05-07 13:57:41 UTC
From: David Kleber
Topic: 6198 Message: 6198

ANNUAL ARMED FORCES DAY CROSSBAND MILITARY/AMATEUR RADIO
COMMUNICATIONS TEST (10 MAY 2014)

1. The Army, Air Force, Navy, Marine Corps, and Coast Guard are co-sponsoring the annual military/amateur radio communications tests in celebration of the 64th Anniversary of Armed Forces Day (AFD). Although the actual Armed Forces Day is celebrated on Saturday, May 17, 2014, the AFD Military/Amateur CROSSBAND Communications Test will be conducted 10 May 2014 to prevent conflict with the Dayton Hamvention (16-18 May 2014), which is the same weekend as the actual Armed Forces Day.
2. The annual celebration features traditional military to amateur cross band communications SSB voice and Morse Code tests. These tests give Amateur Radio operators and Short Wave Listeners (SWL) an opportunity to demonstrate their individual technical skills, and to receive recognition from the appropriate military radio station for their proven expertise. QSL cards will be provided to those stations making contact with the military stations.
3. PART I. MILITARY-TO-AMATEUR CROSS BAND SSB & CW TEST CONTACTS. Military-to-Amateur cross band operations will take place on the dates/times in ZULU (UTC), and frequencies listed below for each station. Voice contacts will include operations in single sideband voice (SSB). Some stations may not operate the entire period, depending on propagation and manning. Participating military stations will transmit on selected Military MARS frequencies and listen for amateur radio stations in the Amateur bands indicated below. The military station operator will announce the specific amateur band frequency being monitored. Duration of each voice contact should be limited to 1-2 minutes. The following stations will be transmitting on MARS frequencies listed below which are provided as "Window/Dial Frequency" in kHz. Some stations will use CW to provide the opportunity to check in by Morse Code.

8. SUBMISSION OF SECRETARY OF DEFENSE TEST MESSAGE ENTRIES. Transcripts of the RTTY, PACTOR, AMTOR, PSK-31, MFSK and MT63 receiving test should be submitted "as received". No attempt should be made to correct possible transmission errors. Provide time, frequency and call sign of the military station copied, including name, call sign, and address (including zip code) of individual submitting the entry. Ensure this information is placed on the paper containing the test message. Each year a large number of acceptable entries are received with insufficient information, or necessary information was not attached to the transcriptions and was separated, thereby precluding issuance of a certificate. Entries must be sent to the appropriate military address as follows:

A. STATIONS COPYING SECRETARY OF DEFENSE MESSAGE TRANSMITTED FROM AAZ, WAR OR AAC SEND ENTRIES TO:

ARMED FORCES DAY CELEBRATION
COMMANDER NETCOM
ATTN: NETC-ATD (MARS STATION)
BLDG 90549 JIM AVENUE
FORT HUACHUCA, AZ 85613-7070

B. STATIONS COPYING SECRETARY OF DEFENSE MESSAGE TRANSMITTED FROM NBL, NNN0ASF, NNN0CQQ, NUW, NWKJ OR NWVC SEND ENTRIES TO:

ARMED FORCES DAY CELEBRATION
CHIEF, NAVY-MARINE CORPS MARS
CHEATHAM ANNEX BLDG 117
108 SANDA AVENUE
WILLIAMSBURG, VA 23185-5830

C. STATIONS COPYING SECRETARY OF DEFENSE MESSAGE TRANSMITTED FROM AGA2SY, AGA5SC, AGA9TR OR AFA4AR SEND ENTRIES TO:

ARMED FORCES DAY CELEBRATION
38 CYRS/CHIEF, AF MARS

203W LOSEY ST, RM 1200
SCOTT AFB, IL 62225

Subject: [SATERNSouth] SATERN So . Terr. Digital Net to monitor status

Last week the SATERN So. Terr. Digital Net was actively monitoring the net frequency 14.065 USB in support of stations in the affected areas of the severe weather that crossed the Southern Territory. Quite a few stations joined us in that vigil and were very welcome in that effort (see the SATERN So. Terr. Update for last week.).

It is shaping up to be another round of possibly severe weather stretching into the weekend. If you are a digital ham and wish to join us in this effort, we will be passively monitoring the net frequency until the National Weather Service begins issuing severe weather statements for areas of the Southern Territory.

Currently, there is a line of very strong thunderstorms stretching from South TX to the Upper Plains in the Midwest. Some of these storms may become severe later in the day and tomorrow with the treat of tornado conditions that may exist in some areas of that region.

We wish to have monitors on frequency until the threat has passed or until it is clear there is no longer the need. That requires more than one station be listening during the most active hours of the weather activity.

We are just now entering the most active weather period for this year. The month of June begins the hurricane season and it is predicted to once again be active above average for the year. Now is the time for us to be practiced and ready for that day when we may be called upon.

de AD5XJ Ken SATERN So. Terr. Net Mgr.

6202. ICOM video on digital comms with FLDIGI

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-05-15 15:43:03 UTC
From: David Kleber
Topic: 6202 Message: 6202

Hello all,

The following video is somewhat specific to setup and ops with FLDIGI and the IC-7200 (I have the 7200 and highly recommend it for use on digital).

IC 7200 Digital Modes

IC 7200 Digital Modes
View on youtu.be Preview by Yahoo

This is a fantastic video for any new ham to digital to watch. Only a small portion of the video is specific to the IC-7200 and a great deal more time is spent showing the basic FLDIGI setup and operations.

If you know someone who wants to get going with FLDIGI, this is a prefect introduction video to help them get started, regardless of what transceiver they're using.

From: David Kleber
Topic: 6203 Message: 6203

Hello all,

The first Alpha's are out for FLDIGI for the Android smart phone and tablet operating systems. The app is named AndFldigi.

I've already done some limited testing with my Samsung Galaxy III and can tell you all that the basic functions of the app are already working very well.

I got permission, as an active NBEMS alpha tester from the NBEMS development team, to open up a limited test group here on the paNBEMS Yahoo Group.

Please understand that the Alpha testing is in it's very early stages and all functionality and modems have not yet been fully incorporated. Also, expect there to be many alpha version updates and you would be expected to keep current on the versions during your testing.

 If you have an Android smart phone or tablet that is no older than 2 or 3 years, and would like to help with testing, please let me know by email at:
my call sign at yahoo dot com. Once I get your email, I will provide the location for the alpha download of AndFldigi along with some basic info on installation and operation off the app.

Thanks.

Patrick

Sgnalink has adapters for yaesu and other radio. I think there's a 6 pin mini din plug for that radio. Use it to get on the air with FLDIGI..

Patrick

Sgnalink has adapters for yaesu and other radio. I think there's a 6 pin mini din plug for that radio. Use it to get on the air with FLDIGI..

Dave, this was excellent.
Do you know if there are Mac drivers for the 7200?

Thanks again for passing this along.

Hello all,

The following video is somewhat specific to setup and ops with FLDIGI and the IC-7200 (I have the 7200 and highly recommend it for use on digital).

IC 7200 Digital Modes

IC 7200 Digital Modes
View on youtu.be
Preview by Yahoo

This is a fantastic video for any new ham to digital to watch. Only a small portion of the video is specific to the IC-7200 and a great deal more time is spent showing the basic FLDIGI setup and operations.

If you know someone who wants to get going with FLDIGI, this is a prefect introduction video to help them get started, regardless of what transceiver they're using.

Hello all,

The first Alpha's are out for FLDIGI for the Android smart phone and tablet operating systems. The app is named AndFldigi.

I've already done some limited testing with my Samsung Galaxy III and can tell you all that the basic functions of the app are already working very well.

I got permission, as an active NBEMS alpha tester from the NBEMS development team, to open up a limited test group here on the paNBEMS Yahoo Group.

Please understand that the Alpha testing is in it's very early stages and all functionality and modems have not yet been fully incorporated. Also, expect there to be many alpha version updates and you would be expected to keep current on the versions during your testing.

If you have an Android smart phone or tablet that is no older than 2 or 3 years, and would like to help with testing, please let me know by email at:

my call sign at yahoo dot com. Once I get your email, I will provide the location for the alpha download of AndFldigi along with some basic info on installation and operation off the app.

Thanks.

The interface is TTL logic level (5 volts) you can not directly connect RS232 signal to the radio. RT Systems has the correct USB<->TTL interface available for the 897D.

6223. help with NBEMS demo tonight (Wed May 28)

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-05-28 19:44:05 UTC
From: dave.kleber@...
Topic: 6223 Message: 6223

Hello all,

I'll be doing a small demo for a club station in SW PA this evening.

Weather permitting (forecast calls for scattered thunderstorms), I should be on 7.0725 USB sometime between 7 and 8 PM ET this evening.

If any stations can be on the air during that time to help out with the demo it would be greatly appreciated. My goal is to do some live on the air demonstrations of FLMSG and FLAMP.

We'll most likely be using modes Olivia 8/500, MFSK-32, 5xPSK63R and MT63 500 Hz long interleave. MT63 500 will only be used if we experience a very high level of QRN/static crashes.

I hope the weather will hold off so we can get on the air. The station call will be W3KWH and we will be +/- 2k from 7.0725 USB, 1500 Hz waterfall center.

Thanks!

Subject: [ArkansasHFDigitalNVISNet] QST - AHDNN Net during Field Day

The Arkansas HF Digital NVIS NET (AHDNN) will be conducted from the Field Day site of N5AT on Saturday, June 28, between 1600h and 1700h CDT, 7.070 mhz 1000Hz +/-, MT63-500L.

Technician Class Licensees - SPECIAL NOTICE: Please be aware that you have CW privileges on that frequency and that you may check-in with CW on Center Frequency, we are listening out for you!

The net will be conducted using the NBEMS software suite with FLDIGI and FLMSG as to facilitate section "7.3.6. Message Handling” of the ARRL Field Day 2014 Rules.

Remember: 10 Field Day points per NTS style message passed!

We request participation by other NBEMS Nets and NBEMS enthusiast, so that we all may show our fellow hams the utility of this great software suite.

Thank you!

Subject: [NY-NBEMS] VOA Radiogram, 28-29 June 2014 (CQ FD)

Hello friends,

Some of our North American listeners may be busy this weekend because of the annual amateur radio Field Day event. If you are participating, you might want to take a break to tune in VOA Radiogram and demonstrate the concept to other radio amateurs. This weekend's program will include items that will be of interest to anyone involved in radio.

Here is the lineup for VOA Radiogram, program 65, 28-29 June 2014 (MFSK32):

1:36 Program preview
2:40 Field Day greetings to radio amateurs, with image
5:03 VOA Cold War broadcasts from a Coast Guard cutter, with image
14:25 Scientists push for continued HAARP funding, with image
23:08 Associazione Italiana Radioascolto 10M river beacon, with image
26:30 Closing announcements

There will also be two surprise modes at the end of the show.

Please send reception reports to radiogram@voanews.com.

Again this weekend, VOA Radiogram is recorded at a sample rate of 8000 Hz. This does not seem to have any negative effect on the decoding of the digital modes, but it does make the opening and closing music sound muddy and low-fi. Now that I've remembered the Fldigi Configure > Sound Card > Wav setting, things should be back to normal next week.

VOA Radiogram transmission schedule
(all days and times UTC):
Sat 0930-1000 5745 kHz
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1930-2000 15670 kHz
All via the Edward R. Murrow transmitting station in North Carolina.

This weekend, The Mighty KBC will also transmit greetings to Field Day participants this weekend. A minute of MFSK64 will be transmitted Saturday at about 1130 UTC on 6095 kHz, and Sunday at about 0130 UTC (Saturday 9:30 pm EDT) on 9925 kHz. Both frequencies are via Germany. Reports to themightykbc@... .

I hope you can tune in and email in this weekend.

Topic: 605 Message: 6234

Hello all,

I'm stuck working this weekend but hope to be on the air for Field Day from my home station from about 9pm ET Saturday evening to around 1am ET Sunday morning.

I wonder if any folks on the list here plan on running NBEMS/FLDIGI. I know a lot of ARRL sections have talked about using FLMSG for their messages to their Section Emergency Coordinators.

I'm sure a lot of folks here on the list would be interested to hear about you or your club's plans.

Hi Dave,

Sorry to hear you have to work. All companies should declare Field Day
a paid holiday :-)

I am hoping to do a little bit of NBEMS with the Warminster Amateur
Radio Club at the Shrine of Our Lady Of Cestohova in Doylestown, Pa.
Will there be a net on Sunday morning. It would be great to pass the
Field Day traffic. I'll be using a Buddy Pole and I'm not sure what
band I'll be able to use. Either 40 or 80 meters.

Ron,

Both of the paNBEMS nets will be running Sunday morning. I'll run the 80m net on 3.583 USB at 0930 ET and WT will be running the 40m net on 7.0725 USB at 1100 ET.

Glad to hear you're working NBEMS into the Field Day activities. It's a perfect opportunity to use FLMSG for those SEC message bonus points.

Just a point of clarification,

The paNBEMS nets this Sunday are not coordinated with ARRL/ARES for the SEC messages. Make sure you all contact your ARRL/ARES SEC's and EC's to see if your section has any NBEMS/FLMSG schedules for the movement of the SEC bonus point messages.

6240. Field Day - Class F EOC Stations?

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-06-28 02:03:12 UTC
From: David Kleber
Topic: 6240 Message: 6240

I'm wondering if we have any FD folks running the "F' class for Emergency Operations Centers this year?

-Dave, KB3FXI

4.8. (Class F) Emergency Operations Centers (EOC): An amateur radio station at an established EOC
activated by a club or non-club group. Class F operation must take place at an established EOC site. Stations may
utilize equipment and antennas temporarily or permanently installed at the EOC for the event. Entries will be
reported according to number of transmitters in simultaneous operation. Class F stations are eligible for a free VHF
station. At Class 2F they are also eligible for a GOTA station.
4.8.1. For Field Day purposes, an Emergency Operations Center (EOC) is defined as a facility
established by:
a) a Federal, State, County, City or other Civil Government, agency or administrative entity; or,
b) a Chapter of a national or international served agency (such as American Red Cross or Salvation Army) with which your local group has an established operating arrangement;
4.8.1.1. A private company EOC does not qualify for Class F status unless approved by the ARRL Field Day Manager. 4.8.2. Planning of a Class F operation must take place in conjunction and cooperation with the
staff of the EOC being activated.
4.8.3. Other provisions not covered are the same as Class A.
4.8.4. A Class F station may claim the emergency power bonus if emergency power is available at
the EOC site.
4.8.4.1. The emergency power source must be tested during the Field Day period but you are not required to run the Class F operation under emergency power.

Doug,

W1HKJ (Dave) is very careful on his programming. I would disregard any warnings from Norton.

You can search the nbemsham yahoo group for many "norton" and other antivirus topics.

I might suggest running MS Security Essentials which is free. Just using common sense (don't open attachments from strange email addresses or open links that have strange addresses that don't match the message) and running the Windows Security, I've not had any virus issues going back about 12 years.

Just my opinion, from personal experience, the pay anti-virus stuff, way back when I used it, caused me more problems than it solved.

Hi Dave, They are here in Columbiana county,Ohio. Located in Lisbon,Ohio by the Lisbon area Amateur radio Assoc.
Gary/KB8HTU

On Friday, June 27, 2014 10:03 PM, "David Kleber kb3fxi@... [paNBEMS]" <paNBEMS@yahoogroups.com> wrote:

I'm wondering if we have any FD folks running the "F' class for Emergency Operations Centers this year?

-Dave, KB3FXI

4.8. (Class F) Emergency Operations Centers (EOC): An amateur radio station at an established EOC
activated by a club or non-club group. Class F operation must take place at an established EOC site. Stations may
utilize equipment and antennas temporarily or permanently installed at the EOC for the event. Entries will be
reported according to number of transmitters in simultaneous operation. Class F stations are eligible for a free VHF
station. At Class 2F they are also eligible for a GOTA station.
4.8.1. For Field Day purposes, an Emergency Operations Center (EOC) is defined as a facility
established by:
a) a Federal, State, County, City or other Civil Government, agency or administrative entity; or,
b) a Chapter of a national or international served agency (such as American Red Cross or Salvation Army) with which your local group has an established operating arrangement;
4.8.1.1. A private company EOC does not qualify for Class F status unless approved by the ARRL Field Day Manager. 4.8.2. Planning of a Class F operation must take place in conjunction and cooperation with the
staff of the EOC being activated.
4.8.3. Other provisions not covered are the same as Class A.
4.8.4. A Class F station may claim the emergency power bonus if emergency power is available at
the EOC site.
4.8.4.1. The emergency power source must be tested during the Field Day period but you are not required to run the Class F operation under emergency power.

6244. Fw: [SATERNSouth] SATERN So. Terr. Special Notice

Here's a forward from our friends in the So. Terr. SATERN group.

Let's hope our first hurricane of 2014 doesn't wind up being a disaster. It looks like our friends in NC will be keeping a close eye on this storm.

Subject: [SATERNSouth] SATERN So. Terr. Special Notice

We have been watching a weather feature just off the Florida Atlantic Coast all weekend. This morning, the National Weather Service has issued the following report:

Summary of 800 am EDT...1200 UTC...information
---
location...27.5n 79.2w
about 95 mi...155 km se of Cape Canaveral Florida
about 215 mi...345 km NNW of the northwestern Bahamas
maximum sustained winds...35 mph...55 km/h
present movement...stationary
minimum central pressure...1007 mb...29.74 inches
Watches and warnings
---
changes with this advisory...
None.
Summary of watches and warnings in effect...
A tropical storm watch is in effect for...
* East Coast of Florida from Fort Pierce to Flagler Beach
A tropical storm watch means that tropical storm conditions are possible within the watch area...in this case within 24 to 36 hours.
Interests elsewhere along the southeast coast of the United States should monitor the progress of this system.
For storm information specific to your area in the United States... including possible inland watches and warnings...please monitor products issued by your local National Weather Service forecast office. For information specific to your area outside of the United States...please monitor products issued by your National meteorological service.
Discussion and 48-hour outlook
---
at 800 am EDT...1200 UTC...the center of Tropical Depression One was located near latitude 27.5 north...longitude 79.2 west. The depression has remained nearly stationary during the past few hours.

A northwestward motion is expected to begin later today...followed
by a turn toward the north on Wednesday. On the forecast track...the
center of the tropical cyclone is expected to remain just offshore
and move east of the east-central coast of Florida during the next
day or so. The system is forecast to pass east of northeastern
Florida on Wednesday and Wednesday night.
Maximum sustained winds are near 35 mph...55 km/h...with higher
gusts. Some strengthening is forecast during the next 48 hours...
and the depression is expected to become a tropical storm later
today. During the past few hours...Settlement Point observation site
on Grand Bahama Island reported sustained winds of 37 mph...59 km/h
with gusts to 43 mph...69 km/h.
The estimated minimum central pressure is 1007 mb...29.74 inches.
Hazards affecting land
---
wind...tropical storm conditions are possible within the watch
area by late today.
Rainfall...the depression is expected to produce total rainfall
accumulations of 1 to 3 inches...mainly across east-central Florida
and northeastern portions of the Florida Peninsula...with possible
isolated maximum amounts of 5 inches through Wednesday. Rainfall
amounts of 2 to 4 inches with isolated maximum amounts of 6 inches
are possible over portions of the northwestern Bahamas through
Wednesday.
Next advisory
---
next complete advisory...1100 am EDT.
Because this storm stands to affect North and South Carolina (at least the Outer Banks), we will be actively monitoring weather conditions along the extreme Easter coastal regions of the Southern Territory.

Volunteers willing to hang out on the Southern Territory Digital Net frequency should be prepared to receive severe weather reports, health and welfare requests, and emergency messages from the affected areas of the Eastern coastal areas of the Southern Territory.

The weather feature is expected to reach Tropical Storm status late today and conditions exist for hurricane conditions before reaching the Outer Banks.

Should effects of the storm increase to a level prompting activation of the Southern Territory SSB 40 meter net or the Southern Territory 20 meter digital net, we will alert members here on the SATERNSouth Yahoo! Group.

Subject: [SATERNSouth] SATERN So. Terr. UPDATE July 03, 2014

H A P P Y F O U R T H O F J U L Y!!!
SATERN In Delta II Mode To Monitor For Hurricane Arthur Traffic
From Thursday, 03 July 2014 through (if conditions warrant it) Friday, 04 July 2014, the International SATERN SSB Net on 14.265.0 MHz and the Southern Territory SATERN Digi-Net on 14.065.0 MHz will be at Delta II status for passive monitoring for traffic related to Hurricane Arthur which is sweeping its' way up the East Coast. According to a message from John Strobel, KØPAL, "Beginning at 1530Z 3 July 2014 SATERN will go to Delta II Mode during daylight hours as part of the Hurricane Watch for Tropical Storm Arthur. … SATERN stations are asked to passively monitor 14.265 beginning after the regular Net until 2400Z. Tentative plans call for continuing Delta II status through Friday 4 July, 2014. This should be passive monitoring. We need simply to maintain a presence in the event someone needs to contact SATERN or The Salvation Army."
Southern Territory SATERN Net Manage Ken Standard, AD5XJ, sent out the following notice: "We will be actively monitoring the digi net frequency today [Thursday] as the development of the storm has come a day faster than earlier predicted. Stations wishing to lend an ear to this effort should tune to 14.065 USB +1000. The mode is OLIVIA 8/500 by default but we may use other modes for message transmission. It is best you keep your RxID on so FLDIGI will follow the current mode and center frequency. Again the SATERN Southern Territory Digital Net will be monitoring our net frequency today until approximately 2:30 PM CDT or until necessary. Volunteer stations may assume NCS duties at various times. Check your print often." As with the International SSB Net, the plan is for monitoring of the Digi-Net frequency to continue through at least Friday, 04 July 2014, provided the conditions warrant that.
All SATERN stations in the Southern Territory are asked to help by monitoring those frequencies whenever possible.
The Salvation Army Prepares For Hurricane Arthur
Charlotte, NC (July 2, 2014) - As Tropical Storm Arthur moves up the East Coast, The Salvation Army is prepared to respond if needed. Canteens (mobile feeding units) are prepared to provide hot meals, cold drinks and snacks. While every disaster is unique and creates its own special needs, the core of The Salvation Army's disaster program consists of several basic services: food service, emotional and spiritual care and emergency assistance.
Divisions under threat from Arthur are working closely with emergency management in their states. The Salvation Army is also coordinating its' preparedness internally with daily Southern Territory conference calls.
While this is the first named storm of the Atlantic hurricane season, The Salvation Army encourages all residents in Arthur's path to review their family communications plan and prepare an emergency kit. Helpful information is available on The Salvation Army Emergency Disaster Services website. Most states along Arthur's path will have a Hurricane Guide,

often available for download. There are also individual and family preparedness information available at various web-sites.
At this point, in-kind donations are not being accepted. Used clothing and used furniture are seldom required during an incident. However, these gifts are vitally important in supporting the day-to-day work of The Salvation Army.
For the latest emergency disaster services news from The Salvation Army, you can follow the social feed on Twitter at @salarmyeds or visitwww.disaster.salvationarmyusa.org.
Hurricane Watch Net Preparing To Activate For Hurricane Arthur
Hurricane Watch Net (07/02/2014) – On Wednesday, the Hurricane Watch Net (HWN) announced that it was preparing to activate for Hurricane Arthur beginning Thursday, 03 July at 1600 UTC (Noon – Eastern; 11:00 AM – Central).
“The current forecast track brings Arthur very close to the outer banks of North Carolina during the evening and overnight hours on Thursday,” said HWN Manager Bobby Graves, KB5HAV. “Since Arthur will be affecting land overnight, the net will initially operate on our primary frequency of 14.325 MHz and then switch to 7.268 MHz when the 20 meter band closes.” He noted that these plans are subject to change.
Graves said the net will gather surface weather observations and report them directly to the National Hurricane Center in Miami. Graves reminded those along the North Carolina coast and especially those on the Outer Banks not to focus on the forecast track line. “The storm could easily track either side,” he said. “Once past North Carolina, Arthur appears to have Nova Scotia in its sights for Saturday, and, if so, the Hurricane Watch Net will be active that day as well. Amateur stations in the affected area should be aware of the storm, and be prepared to operate from a place of safety.”
Those who monitor when the net is active are asked to remain quiet unless specifically called upon for assistance.
The primary operational goals of the Hurricane Watch Net are:
1. To issue storm advisory information on a regular basis to those in the affected area of the forecast path of the storm, and
2. HWN will be requesting measured/observed ground-truth data from those in the affected area. Reporting stations are reminded to not report weather information reported local media. The need is for reporting “personal observations, preferably measured by calibrated instrumentation.”
HWN is also available to provide backup communications facilities to official agencies such as Emergency Operations Centers and American Red Cross officials in the affected area. They are also interested in collecting and reporting significant damage assessment data back to FEMA officials stationed in the National Hurricane Center.

Please honor their request to not check in to the net unless specifically requested to do so. They will attempt to handle all communications within the capabilities of their own members, and only when required assistance is needed will they ask for help from other stations.
The HWS website (www.HWS.org) can be monitored for storm related advisory updates, graphics displays, and other data made available from the National Hurricane Center.
Graves asked for cooperation in keeping the net’s frequency clear and listening for possible relays.
FEMA Reports Preparedness Status For Hurricane Arthur
(FEMA Daily Situation Report For Thursday, 03 July 2014) – Hurricane Arthur is located 340 miles SW of Cape Hatteras, NC and moving north at 9 mph. A turn toward the northeast with an increase in forward speed expected today, followed by a further increase in forward speed tonight and Friday Maximum sustained winds are 75 mph with higher gusts. Some additional strengthening is forecast in the next 24 hours.

The core of Arthur is expected to approach the coast in the hurricane warning area tonight. Hurricane force winds extend up to 25 miles from the core and Tropical Storm-force Winds extend up to 90 miles.
Watches and Warnings:
Hurricane Warning issued from Surf City, NC to the NC/VA border, including the Pamlico and eastern Albemarle Sounds
Hurricane Watch issued from Little River Inlet to south of Surf City
Tropical Storm Warning in effect from South Santee River, SC to Surf City, NC; the NC/VA border to Cape Charles Light, VA, including the mouth of the Chesapeake Bay, and for the western Albemarle Sound
Hazards Affecting Land:
Storm surge of 2 to 4 feet in North Carolina Outer Banks and Pamlico and Albemarle Sounds possible; 1 to 3 feet possible in southern North Carolina and northeastern South Carolina; and 1-2 feet possible in extreme southeastern Virginia
Arthur expected to produce 1 to 2 inches of rain across eastern Florida peninsula; 2 to 4 inches of rain with isolated amounts of 6 inches over the coastal areas of North Carolina through Friday
Swells generated by Arthur are affecting portions of the east-central coast of Florida; these hazardous conditions will gradually spread northward along the coasts of northeast FL, GA, and SC
Response:
FEMA HQ:
= National Response Coordination Center (NRCC) will activate to Level II at 8:00 a.m. EDT today, July 3
= ISB Delta cache recovery team is taking possession of the ISB equipment cache in Selma, AL and, upon notification, wzill deploy to Fort Bragg, NC
= Mobile Emergency Response Support (MERS) will place appropriate teams and assets on alert
FEMA Region IV:
= FEMA Region IV is activated to Level II (7am-7pm daily); Enhanced Watch (7pm-7am)
= Incident Management Assistance Team (IMAT) deployed to NC yesterday, July 2; Initial Operation Facility (IOF) established at the NC EOC = Liaison Officers (LNOs) deployed to NC and SC
= NC Governor declared a State of Emergency for 26 counties
= Dare County issued a mandatory evacuation for Hatteras Island; Hyde County issued a voluntary evacuation for Ocracoke Island
= NC EOC will activate to Level III (Partial Activation) at 8:00 a.m. EDT on Thusday, July 3
= SC EOC is activated to Level IV (Monitoring)
= All other Region IV State EOCs remain at normal operations
FEMA Region III
= FEMA Region III is activated to an Enhanced Watch; Issued an Advisory Notification to personnel
= VA EOC activated at Increased Readiness/Level III
= All other Region III State EOC remain at Normal Operations
FEMA Region I
= FEMA Region I transitions to Level III at 8:00 a.m. EDT today and Level II at 8:00 a.m. EDT Friday
No unmet needs or shortfalls identified; no requests for FEMA assistance

Subject: [NBEMSham] VOA Radiogram, July 5-6 2014

VOA Radiogram this weekend includes news of some rather sudden reductions to the shortwave output of the Voice of America and other entities of U.S. international broadcasting.

It's all in MFSK32 except for 2 MFSK64 images, and the surprise mode at the end of the show.

Details here: bit.ly/1xw1iCK

Schedule (days/times UTC):
Sat 0930-1000 5745 kHz
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1930-2000 15670 kHz
All via North Carolina

If you are in the skip zone for 17860 and 15670 kHz, try this SDR receiver in the Netherlands http://websdr.ewi.utwente.nl:8901/

The Mighty KBC will transmit a minute of MFSK64 tonight at about 9:30 pm EDT on 9925 kHz (via Germany). The image is one of DJ Eric van Willegen's fleet of classic US-made cars.

It would have been an even better story, had the writer posted the boys call signs and license class. It does not appear as if they were actually operating, but either search and pounce or were just sitting there for the photo op.
Getting the youth involved in amateur radio is a big part of what Field Days is all about - has very little to do with contesting or having a picnic.
I had a 9 year old young man approach me with his grandfather at the Ft. Venango Mike and Key club event.
It is ironic that no one would help me to put up my antenna's or take them down or offer me a tent this year, but when they wanted to use my radio - I was the only one in the group that obliged and put their grandson on the air.
Since it was a crash course tutorial - I basically told him what to do.
His grandfather wrote him a simple script.
We took turns stepping on his toes and slapping him in the arm to get him to press the mic PTT at the right time.
Eventually he managed to make his 10+ contacts, we did miss out on a couple of opportunities to make more due to the band going short and long on 40M after 8PM.
When the boy left, he really didn't want to go - because he was having too much fun trying to make contacts.
The parents got tired quicker then the son.
For me it was very nerve wracking to have to operate, log, dupe and tell the boy when to talk and what to say - all at the same time.
I wish the club would have used an electronic log - but that will be for next year.
As promised, each and every club member was only out for themselves and there was a lot of cross talk when three people tried to use the same band at the same time without any filtering.
It made them wonder how the one station I worked was a 28A......

28 station all on the air at the same time would be a very neat field days situation.

Our ARES group (Northwest Riverside County, CA - www.aresnwrc.org http://www.aresnwrc.org) is new to NBEMS. I'm looking for any SOP's others have developed for implementing and using NBEMS. I have the Intro and Advanced NBEMS docs. What I'm looking for are the standard operating procedures your group is following for Nets and drills. Would appreciate any documents you care to share.

VOA Radiogram for the weekend of July 12 and 13 will include news about
the Night of Nights commemoration of the commercial maritime
radiotelegraphy industry.

Details at: bit.ly/1qsDOds

More information about Night of Nights, July 1300 at 0000-0700 UTC, is at...

http://www.radiomarine.org/

VOA Radiogram transmission schedule
(all days and times UTC)
Sat 0930-1000 5745 kHz
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1930-2000 15670 kHz
All via the Edward R. Murrow transmitting station in North Carolina

What I have done in the past is to monitor the relevant frequencies and if there is a net, to wait until new check in's are called.
Then give only the information asked for and nothing else.
If the NCS is interested in the information I have for them, they will ask for more information.. If I am being glossed over or forgotten, it is just as easy to monitor as it is to shut off the radio and do something else.

Being the only ham in a 3 county area to participate in the nets and the only REAL HAM in the county, I have had the opportunity to be the NCS station on occasion when there was real emergencies and there was no one available to man the radios.

Having a dual band UHF / VHF mobile and being able to hear most repeaters within 50 air miles of my location, I can also relay messages from those that do not operate HF and those that does not have a HF radio and those in the field - such as during a SET...

One local group practices NBEMS on their local repeater.
I have learned more by participating with their nets then I have being a part of the HF nets, because people are not so rushed to practice and then turn off their radios, and you can use faster digital modes on UHF / VHF then you can on HF.....

I would have to say that the most important part is to have frequent nets and to get as many people as possible involved, even if they can only use acoustic coupling, but not to rely on Acoustic coupling in a real emergency. It has been my experience that when you get a bunch of people in one place, all at the same time, that they tend to talk and make noise and that it interferes with your digital activities.

Lean on people to get them to buy a Signalink or Rascal or what ever sound card is available if their transceiver does not have a built in sound card. And, work with new hams and those that are not familiar with computers or FLDIGI.. It is easier to help them in the beginning then to have them ask questions or make mistakes during a vital net..
It seems that most everyone is in such a big hurry to get people on the air and start having nets and trying to get as many check in's as possible, that if you neglect to help those that needs help in the beginning - you end up turning that person off from working digital modes and that is worse then having someone that doesn't know anything at all.

Another key is to keep everyone on the same page.
Don't update software and then expect everyone else to know what you have done or that they have done the same thing, just because it was available on some web site..
People has lives and playing radio has to come second sometimes to what is more important - such as work, family and free time..
Something about a good ham being a well rounded person is the phrase that comes to mind..

6264. paNBEMS macros

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-07-18 23:58:39 UTC
From: jsodus@...
Topic: 6264 Message: 6264

Hello,

Bare with me, please, a relative newbie to fldigi.

I want to make my macros like I found at this site
"http://berkscountynbems.homestead.com/Berks_NBEMS_STD-FLDIGI_Files.html"
Unfortunately, for me anyways, the directions are not clear enough even though I have experience with folders, file-names and extensions.

Here is a copy of those directions:
"Right click on the link above, then click "Save Target As", then save to your desktop or a file directory you will remember.

Open FLDIGI, click on File, arrow over Macros and click on open. Copy the paNBEMSmacros.mdf file to this directory.

Go to Config, Misc and click on the Macros tab. Check both boxes marked "load last macro file on startup" and "display macro filename on startup". Click save, then click close."

As you can see, I'm told to right-click on a link; but two links were provided, so which one to choose??
The one link with 'macros' in the file-name takes me to green houses !!; but wait..notice that's the one in the directions.
The other link has the macros I want, so I guess that's the one.
Do I change the file-name at some point?

I'm confused, especially since that page is three years old; the directions must be right, huh?

Jerry,

It looks like they have two sets of macros... the first, I'm guessing, is for general users and the other is for NCS operations. Both are .mdf extensions, which are macro files for NBEMS/FLDIGI.

You should be able to right click and do the save as for each of them, then follow your directions for moving those into the FLDIGI macro file directory.

Hello Dave KB3FXI,

I recognize your name and call.
Just earlier today, I used your video towards setting-up my SignaLink-USB with CheckSR.exe.
It went very well for me.
Thank you for your good work.

Please visit the site I mentioned
"http://berkscountynbems.homestead.com/Berks_NBEMS_STD-FLDIGI_Files.html".
You'll see a link on the left-side paNBEMSmacros.mdf.
If you use it, you'll be surprised to see that it has absolutely nothing to do with macros.
Rather, among the topics covered are "making your home more green", or "how to become a mortician" (isn't that a laugh?).
So something is seriously, seriously fouled up there.

The other link, the one on the right, takes me to macros but there I'm confused about what to do.

Ok, Jerry.

That's an error on their website.

The other file on the right looks good.

Once you have that one saved, just copy to the macro files folder in FLDIGI according to the instructions you listed in your original message.

Hi Dave,
OK for only part of the directions.

I have the desired file in the correct folder (the same folder that has the original macro that came in fldigi).
I see that I will have to alter the file's name, which right now is "paNBEMS_NCS_mdf.mht".

The directions tell me to "Go to Config, Misc and click on the Macros tab".
Problem is that, on my fldigi version 3.21.83 (the latest), when I follow those directions, there is no Macro tab.

Hunting around the menus, I see nothing that looks like it would do the next set of directions, which are "Check both boxes marked "load last macro file on startup" and "display macro filename on startup". Click save, then click close."

So I'm stuck.
Might you have any contacts with the Berks site people?

My only comment would have to be that the use of the term 599 using digital modes is erroneous unless in fact the signal was pushing your S meter to S9..
One of the worst things about working digital modes is the bs that goes on with the canned responses that has no relevance and the lack of conversation - especially during a contest or special event station.

Most operators are too lazy to give an honest signal report and they expect to get a 599 each time they make a contact because then they do not have to enter anything different into the log, so it just automatically logs as being 599....

Even with that, 599 is a CW term, that includes Tone and signal strength - readability doesn't really count in digital modes - since some digital modes can be pulled out - even if it is below the signal noise floor.
Good contact Dave...

Well, Jerry... I suppose you could invent a new way to report digital mode signal reports and convert the worldwide amateur digital radio community.

As far as contesting ops go, it would kinda go against the purpose of such events which is to make as many contacts as possible. Special events are a bit different and many times the ops will get into short chats to explain their event. I just gave my quick report (freehand, btw) to let the Panama station move on to make more contacts.

I though it was pretty cool making a 20m contact to Panama at 0130 ET during this lull in the current solar cycle.

My only comment would have to be that the use of the term 599 using digital modes is erroneous unless in fact the signal was pushing your S meter to S9..
One of the worst things about working digital modes is the bs that goes on with the canned responses that has no relevance and the lack of conversation - especially during a contest or special event station.

Most operators are too lazy to give an honest signal report and they expect to get a 599 each time they make a contact because then they do not have to enter anything different into the log, so it just automatically logs as being 599....

Even with that, 599 is a CW term, that includes Tone and signal strength - readability doesn't really count in digital modes - since some digital modes can be pulled out - even if it is below the signal noise floor.
Good contact Dave...

Dave!

Good job and great that you made the contact!

See being a wake at 0130L has its benefits.

Regards,

W.T.

No coffee here, Skip. Can't drink the stuff any more.

Anyway, it was pretty cool to see 20m open at 1:30 am ET last night. It's been a long time since I've seen the band open that late. 17 and 10 were dead.

I remember back at the last solar max, 10m would be wide open at 2am ET. It's been a long time since that has happened.

I too have experienced some unusual propagation lately on 20m.
The longest contact was Australia about 11:30 PM on 20M phone.
EA3JE - LOU - is operating from Barcelona Spain on 14.206 phone , his station is very strong.
10/9 - Lou's audio is distorted from his amplifier being over driven.
Most of 20 M has been in very bad shape lately.

Rodger on the new scale for RST for digital modes.
I will talk to my instructor at Penn State this semester and we can brainstorm an idea.
One idea is to completely scrap the 599 RST, and go with

Weak, Moderate, Strong, and Very Strong.

From: webberm@...
Topic: 6284 Message: 6284

The Virginia Digital Net (VDN) is being rebooted!

Starting on Mon Aug 4th the VDN will meet on Mon & Wed at 6:30pm ET. If we can get additional NCS we can look to expanding the number of days the net meets. If you are interested in being a NCS for this net send me an email w4mrw@arrl.net mailto:w4mrw@arrl.net

We meet on 3.578.5 kHz USB 1300 hz waterfall - Olivia 4/500
Messages will be passed using MT63-1KL

VDN is an ARRL NTS section-level net and it is hoped that we can be a liasion for passing traffic into and out of the Northern Virginia Traffic Net (NVTN). The NVTN meets every evening on 147.300 @ 7:30pm

If you want to participate it is recommended that you install the FLDIGI suite of applications as we will be passing ARRL Radiogram messages using FLMSG. If you need any assistance setting up FLDIGI you can contact Mark, W4MRW at w4mrw@arrl.net mailto:w4mrw@arrl.net

Look forward to seeing you on the waterfall and passing traffic.

73,

Mark / W4MRW

Sent: Wednesday, August 6, 2014 6:41 PM
Subject: [NY-NBEMS] VOA Mandarin MFSK16

Hello friends,

The MFSK experiments on the VOA Mandarin Service continue, but now we are switching from MFSK32 to MFSK16, centered on 2000 Hz.

These will be daily at ...

2258 UTC 6135 9845 kHz
0058 UTC 9880 15385 15565 17560 kHz

...via Asian relay transmitters.

The center frequency for the MFSK16 is 2000 Hz. The audio as received may be plus or minus a few Hz. MFSK16 requires precise tuning of the audio frequency. If you can record the audio, this will give more than one chance to tune the audio to the correct frequency.

Reception in Europe and North America is possible. Chinese domestic radio is usually co-channel with VOA Mandarin, and usually dominant. The VOA Mandarin MFSK tones may come through well enough for at least some decoding outside of Asia.

Here are two recent videos of VOA Mandarin MFSK32 reception and decoding in Japan...

40 mtrs can be a bear, especially in the mornings. I usually check in to a MARS net that covers all of Tennessee. Frequently stations in East Tennessee can only hear stations in West Tennessee. Stations in Arkansas or OK actually will come in better. When 40 mtrs goes long, stations in the same geographical section of the state cannot hear one another.

What the NCS will do is designate someone in say Middle TN to act as net control temporarily just to get checkins and relay those into the net. We may have several stations get checkins and relay comments to NCS. This morning a North Carolina station got comments from 12 stations, including one in Indiana.

The problem comes from stations not waiting until someone they can hear well asks for checkins. It creates chaos. Hopefully the NCS will have enough sense to call on a station that is NOT the strongest to make a net call. If several stations in different regions gets checkins, eventually all stations will get checked in.

We frequently have 20 to 25 checkins and everyone gets to make comments.

That's how we used to do NTS voice nets on 40m during times of uncooperative propagation. It's a good, time-honored system, gets the job done.

6293. SGARN Multicast Transmission Schedule

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-08-10 00:55:33 UTC
From: Charles Brabham
Topic: 6291 Message: 6293

Call: N5PVL

Locator: DM80di

Frequency: 10.142.0 or possibly 10.142.2 - 10.142.4 USB +1000 (One of these,
depending on ongoing activity on frequency.)

Time: 0200-0600 and 0700-1100 UTC (A one hour break in the middle of the night)

Mode: MT63-500L

Content: ARRL Bulletins, SGARN Txt and HTML - Emergency information during emergencies.

Note: The best way to utilize this server is to get set up when it starts in the evening, then let your system listen overnight and see what you have in the morning. The first hour is usually subject to interference that drops off later on.

Note that by tuning in for the SGARN overnight multicast, you not only get the latest ARRL bulletins but an idea of overnight propagation conditions on 30 meters.

More information and details about monitoring SGARN multicasts at:

http://www.sgarn.org/forum_library/index.php?topic=9.0

Comments and reception reports always appreciated.

Jerry:

I can tell you that the bands today were the absolute worst.

Our CFARS group is running P3 on a frequency near 30 meters and as you know Pactor 3 and 4 can make it through when the signal is not even heard on the other end. Had some connects from BC and Alberta, but nothing good enough to pass a message on that assignment we were on. I was running 50 watts and the other guys were running 100 watts and same results.

Well, Jerry... I'm not sure what your deal is, but I'm working a full time job to the tune of about 50 plus hours a week. I was at work this morning at 7:45 am ET to conduct my monthly inventory and had the pleasure of leaving work tonight at 8:15 PM ET. If my basement filled up with water, my son and wife would have had to deal with that.

I'm not sure what the "Pittsburgh" reference has to do with paNBEMS or the 7.0725 NBEMS watering hole, but last winter, as you most certainly know, PEMA ACS was activated on several occasions in response to statewide weather events and our NBEMS support wound up being most beneficial to Central and Eastern PA. We also passed along some valuable snow to freezing rain transition reports in another activation to the Pittsburgh National Weather Service.

I monitor 7.0725 every day and 3.583 every night. When I'm home, I spend a good percentage of my time actively monitoring, and when I'm out of the shack - trying to earn a living and to pay my taxes - II leave the station to monitor, except for when there's current or projected thunderstorm activity.

Do me a favor and email me direct if you'd like to continue the discussion or to clarify your comments.

Hello Dave, Due to personal stuff, I never was able to get back to this until now.
I mistakenly thought that I'd have loads of time for ham-radio when I retired. :)

Since my last posting, it looks to me like the website has been revised.
There is only one macro-file to open, which I have done.

Before I get into that, I do want to ask a syntax question about the "/" and "\" marks because there are so many of them.
What are the rules regarding how they get used?
Here is the way I have macro#3 displayed on my screen using NoteBook
(ignore the "" on the line; I was forced to use them to show the line properly here in this posting.):
"// Macro # 3/$ 2 exchange @>><TX>...\n<CALL> de <MYCALL> \n\n\n//"

TIA for any help.

BTW, the link to the Yahoo group needs some attention.

From: David Kleber
Topic: 6264 Message: 6299

Jerry,

Welcome back. I hope you can make some of our nets.

You want to do your editing of macros in FLDIGI by right clicking on a macro and following the macro help file section on NBEMS at FLDIGI Users Manual: Macros

FLDIGI Users Manual: Macros
FLDIGI Users Manual 3.21
View on w1hkj.com Preview by Yahoo

The new help files should cover everything pretty well but if you run into any snags, let us know.

-Dave, KB3FXI

Subject: Re: [paNBEMS] paNBEMS macros

Hello Dave,
Due to personal stuff, I never was able to get back to this until now.
I mistakenly thought that I'd have loads of time for ham-radio when I retired. :)
Since my last posting, it looks to me like the website has been revised.
There is only one macro-file to open, which I have done.
Before I get into that, I do want to ask a syntax question about the "/" and "\" marks because there are so many of them.
What are the rules regarding how they get used?
Here is the way I have macro#3 displayed on my screen using NoteBook
(ignore the "" on the line; I was forced to use them to show the line properly here in this posting.):
"// Macro # 3/$ 2 exchange @>><TX>...\n<CALL> de <MYCALL> \n\n\n//"
TIA for any help.
BTW, the link to the Yahoo group needs some attention.

Hi All-

"ROGER" here KD2CRS. New to this group.
So I'll throw a quick question out there for some clarification.

How did PA decide to go with NBEMS and not Winlink?

Now there is a topic worth discussing?

Questions and comments welcome always welcome.

Short answer:

Winlink is only useful on windows machines.

Long answer:

With a KISS interface already completed (but not released) use of BPQ32 is now an option. Making WINLINK unnecessary.

The Benefit of BPQ32?
It run on more the just a Windows machine.

BPQ32/FLDIGI combo uses ARQ (the same used in FLARQ) and AX25 protocols over the air with selected IP protocols via the Internet. BPQ supports multiple hardware and software modems not just FLDIGI.

BPQ32 does allow you to use Thunderbird e-mail program to send/receive mail via the airwaves. BPQ32 is more extensive then this, but I don't have a list in front of me to inform you.

There is a yahoo group for BPQ32. A quick search will point the way.

WINLINK is a closed system, I don't think you can interface WINLINK over the air with BPQ32. But I wouldn't be surprised if you could via the internet.

Not having a windows machine dedicated for radio work, I don't have much interest with WINLINK and by extension any vast knowledge of it beyond it's surface (grain of salt time).

I do believe FLDIGI/BPQ32 will support a similar purpose while being able to run on the big three OS's (Linux, MacOSX, and Windows)

Rioger,

NBEMS is a set of tools to transfer information. The tools set is designed around a connectionless ideology. This way a single transmission can be received by all interested parties. No connections are made with the exception of FLARQ.

FLDIGI is a software based modem and contains no protocols, the supporting programs handle these features.

FLMSG is used to send ICS/Basic Plaintext/HTML formatted messages with checksum verification.

FLWRAP for encapsulation of data in a checksum verifiable form.

FLAMP for binary and pain text file transfers. Connectionless, but parts can be retransmitted to fill missing data, all under user control.

FLARQ is a connection based data/email transfer point to point. With no forwarding unless the end point connection is with BPQ32.

The email and bulletin board style system requires the use of BPQ32. BPQ32 when used with FLDIGI supports FLARQ and AX25 connections protocols, mail forwarding and a host of other neat features.

Attachments would be handled using an email client supported by BPQ32. Thunderbird E-Mail Client is known to work.

Topic: 6301 Message: 6311

Other then the content as restricted by part 97 rules, I would assume binary data is possible if the e-mail program supports mime conversion, which Thunderbird does. Outside of the rules, bandwidth is the primary concern. FLDIGI does support "High Speed" multichannel modems. Even with these, the size of the file should be restricted to something reasonable. It's still slower then snails compared to the internet. ;-(

Only BPQ32 supports message storage/forwarding and is not part of the NBEMS system. BPQ32 is developed and maintained by John, G8BPQ.

See:
www.cantab.net/users/john.wiseman/Documents/BPQ32.html
www.cantab.net/users/john.wiseman/Documents/FLDigiDriver.html

One small note:

There isn't much in the line of infrastructure as FLDIGI with the required interface has not been released. Although it is complete as seems stable. FLDIGI doesn't support Packet radio modems (any speed). Connecting to a Packet networks on 2 meters (for example) isn't currently possible even though BPQ32 can use AX25 protocol with FLDIGI.

"WINLINK is a closed system, I don't think you can interface WINLINK over the air with BPQ32. But I wouldn't be surprised if you could via the internet. "

Not sure if I am reading this statement correctly, but either OS version of BPQ32 can interface with the WINLINK system via CMS telnet as a gateway station. A psuedo RMS Relay is also possible for RF only forwarding using about any hardware or software modem. This is fully supported by the WINLINK Dev Team to the best of my knowledge so hardly a closed system given the Hybrid stations now online. There is an RMS Gateway written in Linux also, and the WINMOR modem is in development as a port to Linux. The lines between the two worlds are getting rather blurry.

I love both, but there is no real clear distinction any longer between Windows and Linux as far as WL2K goes....FROM THE GATEWAY SIDE. From the client side, WL2K is still pretty much a Windows game. There are slightly convoluted ways of having BPQ32 poll CMS on behalf of BBS users and store their messages on the BPQ BBS, but that's not something one would use for EmComm.

I have been riding the fence of these two camps for some time now, and have decided that I like both very much. I don't have to choose (and neither does anyone else)! :D A lot of EmComm groups are training to both nowadays, because a Signalink is all that's needed for either on HF. WL2K is way easier to train because the interface is designed to be rather rigid. NBEMS is harder to train, but is so much more flexible that it's definitely worth the extra work

Hello Mitch,

The statement about a closed system was not about the ability to interface with others system. It's about the source code not being available as an open source solution. If it had been, I'm willing to bet the software would have ported to other systems by now.

I've heard of the porting to Linux for some time now, though I haven't see any evidence of it. Not to say I'm looking very hard.

The link incompatibility is along the lines of

BPQ32<->WinLink<->Radio<->Fldigi<->BPQ32

If someone wanted to be compatible with FLDIGI in this case, one would only have to look at the source code. Available for anyone who wants to see it.

Hi Robert,

The LinuxRMS Yahoo group is where you find that work happening. There are production systems running it now. It is compiled from source code, so it is available.

BPQ source is also available.

Making open source Windows software isn't as easy as it might sound...lots of strings attached I'm sure. A lot open source people wouldn't consider bothering with Windows anyway just because of the perceived stigma. LOL! Thankfully Dave is not one of those folks. The choice to select Windows as the primary client platform for WL2K was practical since most casual computer users will be able to install and use it.

I think people just decide to believe what they want no matter what the truth is, and no amount of explaining will change their minds. Since you were kind enough to explain what you meant, I thought I would give you more information also.

Your flow diagram seems to speak to inter-operability between two very disparate systems. BPQ does seem to be the lone "glue" along those lines. John provides us with many ways to move messages in and out of many different types of systems. It's quite amazing how flexible it really is. I am still learning the nuances of my LinBPQ system. With that flexibility comes many points of failure also.

When one compares a complete global messaging system to a selection of aggregated components, things can get rather muddy and quickly. BPQ allows a lot of flexibility to include FLDIGI components into a system of one's own design, but a well-designed and well-defined network of stations who have a central database for routing messages via internet backbone or RF only attempts to compare two very different animals. I find it difficult to really draw any meaningful comparisons between the two. They both have strengths unique to themselves and that diversity is why I use both. I would rather take advantage of the strengths of both systems rather than polarizing myself and missing out on some great advancements in both "camps".

I appreciate the civil conversation. Rare on these lists.

Hello Mitch,

Understand fully, I have access to BPQ32 source code (v6.0.8.1) and have built the system for MacOSX10.8+ to use with FLDIGI. Works like a champ. I would have released FLDIGI w/KISS I/O by now, but I was waiting to see if one of the other FLDIGI developers had his 8PSK modem finished for a dual release. Seems I'm still waiting. The other project just finished is an update to FLAMP (pending version 2.2.0) and it's in Dave's W1HKJ hand's to ensure it operates correctly on the other platforms. Once that is done and no issues are found it will be release to the beta testers. I don't expect to many issues with it, it seems stable on the Mac OSX.

Yes I'll check out the yahoo group and see what up, if the source is available maybe I'll spend the time porting it to the Mac ;-).

Subject: [NBEMSham] VOA Radiogram, Aug 30-31, includes Tibetan

VOA Radiogram for the weekend of August 30-31 will start with a single straight vertical blue line. If the line is slanted, your sound card may be out of calibration. An adjustment in Fldigi software can correct for this.

The program will also include a sample of Tibetan text.
For this beautiful alphabet to display correctly, you need another adjustment in Fldigi.

The program ends with a surprise-mode gray-scale photo commemorating Labor Day in the United States.

Details:
voaradiogram.net/post/96096466292/voa-radiogram-30-31-aug-2014-vertical-line-tibetan

VOA Radiogram transmission schedule
(all days and times UTC):
Sat 0930-1000 5745 kHz
Sat 1600-1630 17860 kHz*
Sun 0230-0300 5745 kHz**
Sun 1930-2000 15670 kHz*
All via North Carolina.

*If you are in the skip zone for 17860 or 15670, try http://websdr.ewi.utwente.nl:8901/

**You can listen to this one direct and via http://websdr.ewi.utwente.nl:8901/ . Run two instances of Fldigi and compare results.

On Fri Aug 29, 2014 12:24 pm (PDT), mitchwinkle posted, in part:

A lot of EmComm groups are training to both nowadays, because a Signalink is all that's needed for either on HF. WL2K is way easier to train because the interface is designed to be rather rigid.

I would love to know the secret to using WL2K with a Signalink. 2 years ago I spend countless hours trying to interface WL2K with my USB Signalink using AGWPE (both free and paid versions) and was never successful. If you have a working 'recipe' I would love to have you share it with me.
In total frustration, and having the need to have both suites working for FD 2013, I caved in and purchased a TNC-X (works very well) so that I could support WL2K. But that necessitated a switch box, extra cabling, et al and made the package much less compact/portable.

73 es TIA for sharing *the* solution.

Ted,

My EmComm scenario is for a centralized location for a whole state, and not a city or county, so I don't think of Packet WL2K as a solution. Using a Signalink would be for HF only using the RMS Express WINMOR soft modem. There are convoluted software "connectors" to use with AGWPE for packet which involve virtual COM ports and such, but all of that is way to fragile for real EmComm work. If you need to do packet on VHF/UHF, you selected the right tnc in the TNC-X. Nice little unit.

Honestly, If you need a program for WL2K messages that does AGWPE, look at Paclink. AGWPE support is built in and works with a Signalink and most POP3 email clients

73,

Mitch

Ted/Group

Keep it Simple. With these extra programs they are bound to be a problem.
If you have OP who not quite up to steam to fit said problem. Like why
AGWPE not PTT etc.

Just my 00.02 Canadian worth

Robert,

Great that you are so involved in the development side. I only wish I had the skills. I spent most of my programming life in Java and most of that doing servlets and JSP and tons of database work, so I am not of much help with this sort of "blood-n-guts" programming. LOL!

I have toyed about with the KISS betas on FLDIGI and BPQ. Cool stuff, but the lack of a cohesive network of operators makes it difficult to test. (Can you hear the gears turning in my integrator's brain?)

I LOVE LOVE LOVE FLAMP. Such a tremendous program which is so flexible. Really all of that suite of programs are so good. I have offered suggestions for some integration work for FLMSG on the Yahoo group but it can be so offensive at times. Since I have no way to reach developers directly, I just backed off. It's a shame, since a few relatively minor enhancements would make FLMSG so much easier for the typical user to manage. Ah well, I am sure someone else will come up with the same idea eventually.

Yes, it seems that the Linux RMS development is active, so do check it out. The current tarball and patch are in the Files section. I haven't tried it yet since my gateway is running on LinBPQ and I finally got it stable (mostly operator head-space issues ;). I will be building a couple of new machines soon, so I will put it on one and see how it behaves. Should be entertaining.

8PSK modem sounds interesting! Keep me in the loop.

73,

Mitch

---In paNBEMS@yahoogroups.com, <kk5vd@...> wrote :

Hello Mitch,

Understand fully, I have access to BPQ32 source code (v6.0.8.1) and have built the system for MacOSX10.8+ to use with FLDIGI. Works like a champ. I would have released FLDIGI w/KISS I/O by now, but I was waiting to see if one of the other FLDIGI developers had his 8PSK modem finished for a dual release. Seems I'm still waiting. The other project just finished is an update to FLAMP (pending version 2.2.0) and it's in Dave's W1HKJ hand's to ensure it operates correctly on the other platforms. Once that is done and no issues are found it will be release to the beta testers. I don't expect to many issues with it, it seems stable on the Mac OSX.

Yes I'll check out the yahoo group and see what up, if the source is available maybe I'll spend the time porting it to the Mac ;-).

Subject: flamp 2.2.0Pre available for testing

flamp version 2.2.0Pre (pre-release) is available for testing.
Installation files have been posted to

http://www.w1hkj.com/kk5vd/

The documentation is also available on that same web site in both compressed pdf and html format.

The two principle changes for this test version are Data Relay (Digipeater) and Configuration Scripting.

This is the complete list of changes.

Relay, Modems, Scripting, Documentation, and Notices

* Update Copyright (C) to GPL version 3
* Add doxygen based documentation
* Removed .EPS file requirement for PDF generation.
* Add warning dialog when removing files from the transmit queue.
(Request from Frank N3FLL)
* New widgets in receive panel to support data relays.
* Add code for data relays.
* Extend supported 8 bit modems. QPSK31-500, BPSK31-64/64F.
(Request from Charles N5PVL)
* Update timing table in support of added modems.
* Move ztimer code into separate files.
* Add ztimer watch dog to restart ztimer when operator changes system time.
* Update makefile.am to reflect new files.
* Correct modem assignments to hamcast drop down menus 2,3,4.
* Add simple configuration script.
* Add callback interface to script engine.
* Add file run_script.cxx. Script to GUI interface code.
* Add files hamcast_group.cxx/.h. Transmit times updated only when HAMCAST tab has focus. Subclass of Fl_Group;
* Update makefile.am to reflect new file(s).
* Update Doxygen Documentation
* Fixed multiple non error issues with display and file processing.
* Corrected value assignments in script processing for TX interval and block size.
* New command: EVENT TIMED:<ON:OFF>
* Reassigned use of command EVENT:<ON|OFF>

* Modify RESET: to handle EVENT TIMED: and EVENT:
* Update Doxygen Documentation to reflect latest changes.
* Correct data corruption in cAmp with mutex lock/unlocks.
* Data relay functional. Limited to sending all available data on
a file by file basis.
* Thread the Relay transmit, and added interval timer functionality.
* Data relay completely functional.
* Fixed numerous minor errors.
* Add hash values in the receive queue list.
* Update Documentation to v2.2, added new images.
* GUI Widget adjustments for Linux

73, Dave

Greetings, Roger.

Sorry to be so late into the discussion. I work in retail management and I've been putting in some serious hours for the Labor Day event.

We had presented NBEMS at several PEMA Conferences over the last 6 years or so and they were impressed with the facts that NBEMS nets can be run with stations using nothing more than a sound card interface and can even be monitored with nothing more than a plug in microphone near an HF receiver's speaker. They also like the checksum verification on FLMSG messages with the ICS forms.

From our experience with paNBEMS net activations from PEMA, they seem most interested in having us run nets to take check ins from both County EMA stations as well as individual home stations for firsthand reports during weather events. We had 3 or 4 activations last winter.

NBEMS is very conducive to net operations as well as bulletin transmissions, where all the monitoring stations can see and store the messages being transmitted from a single station.

I use Winmor and check my mail at least once a month. I think there's a Winmor net that runs on 80m but I'm not sure by whom or where since there's no way that I can find to monitor Winmor or Pactor nets.

PEMA seems most interested in manned operations for their activations. And NBEMS lets them turn on their HF rigs with the FLDIGI, FLMSG and FLAMP so they can automatically copy all the traffic on the nets.

Hi All-

"ROGER" here KD2CRS. New to this group.
So I'll throw a quick question out there for some clarification.

How did PA decide to go with NBEMS and not Winlink?

Now there is a topic worth discussing?

Questions and comments welcome always welcome.

That's pretty strange. It's running perfectly on my Win 7 64 bit box.

There's probably 50+ people on the alpha team and I haven't seen any such reports from them yet.

Anyone else having problems like Steve describes?

Ok, Steve. I've always configured the auto open in FLDIGI to automatically open FLAMP.

I'll drop a line to the programmers. Regardless of whether you have FLDIGI open or not, the program shouldn't freeze. Maybe they can fix it so that when you open FLAMP before starting FLDIGI, it could pop up a box that says you have to run FLDIGI first.

I've had FLAMP freeze and not want to shut down, if I close FLDIGI first
- So I always let FLDIGI auto-open FLAMP, and shut down FLAMP before FLDIGI.

FLAMP is second to start, and first to shut down. This way, everything
works smoothly and fast.

Hello Steve,

I was just about to ask you that question if FLDIGI was running or not. Just out of curiosity, how many processor(s) does you computer have? In reality it should not do that as the communications run on their own thread. So if the comm thread stalls for some reason, it would (should) not effect the GUI interface. If you have a single processor, this still would not explain the comm hang. These new fangled OS's are supposed to have preemptive task switchers.

Interesting. after working fine for a couple of transmissions using PSK125
.... the file transmitted in Olivia 8-500 not the format specified in FLAMP
and FLAMP crashed/ Starting again.

I saw your RSID but FLDIGI didn't recognize it. I think I see 4 channel PSKR63. Signal to weak to be certain.
Looks like at this time of day it's not going to work.

Please provide detains about 'Format' at the time of crash. I can presume you are running on a Windows XP, 7 or 8 machine?

Robert

Hello Dave,

Hope all went well this weekend.

Can you help me understand how NBEMS can send and retrieve attachments and what the restrictions are?

This is a serious consideration here at the RACES EOC.

Also how well does NBEMS operate for HF long-hall transmissions?

Roger,

FLAMP is an NBEMS file transfer program that works with FLDIGI. You can transfer any kind of file including csv, plain text and binaries. But, binary files tend to be very large and FLAMP transfers of large files on HF are somewhat prohibitive due to transmission times.

What County are you in? Perhaps we could meet on the air on 40 or 80 and I can show you how it works.

Thank you.

1. How does NBEMS store message for retrieval later?

2. How would I get a message if I was not on the air at that particular time??

just curious how many PA county OEM's or Municipalities use NBEMS?

ROGER~

Roger,

Any station running FLDIGI and FLAMP on a given frequency will automatically receive and save the message. When the operator returns to the station, they will see a list of received files. Same thing goes with FLMSG messages.

As far as how many using NBEMS... the PEMA Western, Eastern and SEOC all us NBEMS and at least 12 County EOC's that I'm aware of. I would feel safe to say there are more. It would be nice if they all did, even if it was just setting up a plug in computer mic near the receiver speaker. That doesn't cost anything and it works fairly well for just receiving messages.

Roger,

Store and forward is not currently available in a official release and requires an auxiliary program called BPQ32. A beta version of FLDIGI is available (on request) that can interface with BPQ32 allowing for BBS/e-mail type services.

For the BPQ32 software, head on over to BPQ32 Yahoo group for more information. BPQ32 is a independent software development effort that is not apart of the NBEMS suite. BPQ32 runs on Linux, Windows, and MacOSX.

I think this thread starts with a misconception. First, paNBEMS would not have "NBEMS" in the name if it used the common WL2K protocols. NBEMS concepts started with some additional features built within Fldigi, with the general view that emcomm would be well served if emcomm operators were using methods that they might use every day when rag-chewing or DXing with digital modes. This concept evolved with some "narrow band" modes on HF and then the idea of using wider modes on VHF / UHF developed. NBEMS concepts were developed while the WL2K system was mostly wider band Pactor. Narrower bandwidth Winmor came along later.

6346. NBEMS Net Schedule now in SGARN Multicast

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-09-04 04:40:15 UTC
From: Charles Brabham
Topic: 6301 Message: 6346

Note that a PDF file listing NBEMS net schedules are now included in the nightly SGARN multicast transmission.

Call: N5PVL

Locator: DM80di

Frequency: 10.142.0 or possibly 10.142.2 - 10.142.4 USB +1000 (One of these,
depending on ongoing activity on frequency.)

Time: 0200-0600 and 0700-1100 UTC (A one hour break in the middle of the night)

Mode: MT63-500L

Content: ARRL Bulletins, NBEMS Net Schedules, SGARN Txt and HTML - Emergency information
during emergencies.

Note: The best way to utilize this server is to get set up when it starts in the evening, then let your system listen overnight and see what you have in the morning. The first hour is usually subject to interference that drops off later on.

Note that by tuning in for the SGARN overnight multicast, you not only get the latest ARRL bulletins but an idea of overnight propagation conditions on 30 meters.

More information and details about monitoring SGARN multicasts at:

http://www.sgarn.org/forum_library/index.php?topic=9.0

Comments and reception reports always appreciated.

73 DE Charles, N5PVL
http://www.sgarn.org

For those testing the beta version of FLAMP. A new pre-release version is available (v 2.2Pre4)

This version resolves a multitude of issues.

and can be found here
www.w1hkj.com/kk5vd http://www.w1hkj.com/kk5vd

The provided files are executables only for Linux Mint 13, Windows, and MacOSX 10.8 Intel. No install program provided.

Please provide reports to this group or k k 5 v d (a t) y a h o o (d o t) c o m

Below is a list of changes so far.

Thanks,
Robert, KK5VD

Relay, Modems, Scripting, Documentation, and Notices

* Update Copyright (C) to GPL version 3
* Add doxygen based documentation
* Remove .EPS file requirement for PDF generation.
* Add warning dialog when removing files from the transmit queue.
(Request from Frank N3FLL)
* New widgets in receive panel to support data relays.
* Add code for data relays.
* Extend supported 8 bit modems. QPSK31-500, BPSK31-64/64F.
(Request from Charles N5PVL)
* Update timing table in support of added modems.
* Move ztimer code into separate files.
* Add ztimer watch dog to restart ztimer when operator changes system
time.
* Update makefile.am to reflect new files.
* Correct modem assignments to hamcast drop down menus 2,3,4.
* Add simple configuration script.
* Add callback interface to script engine.
* Add file run_script.cxx. Script to GUI interface code.
* Add files hamcast_group.cxx/.h. Transmit times updated only when HAMCAST
tab has focus. Subclass of Fl_Group;
* Update makefile.am to reflect new file(s).
* Update Doxygen Documentation
* Fixed multiple non error issues with display and file processing.
* 2.1.02AJ
* Corrected value assignments in script processing for TX interval and
block size.
* 2.1.02AK

* New command: EVENT TIMED:<ON:OFF>
* Reassigned use of command EVENT:<ON|OFF>
* Modify RESET: to handle EVENT TIMED: and EVENT:
* Update Doxygen Documentation to reflect latest changes.
* 2.1.02AL-AP
* Correct data corruption in cAmp with mutex lock/unlocks.
* Data relay functional. Limited to sending all available data on
a file by file basis.
* Thread the Relay transmit, and added interval timer functionality.
* Data relay completely functional.
* Fixed numerous minor errors.
* Add hash values in the receive queue list.
* Update Documentation to v2.2, added new images.
* GUI Widget adjustments for Linux
* 2.2.0Pre Release for beta testing.
* FLAMP-2.2Pre2
* Possible fix for modem string name transfer crashing both
FLAMP and FLDIGI.
* Script settings overwritten by panel settings on next file load. Fixed.
* FLAMP-2.2Pre3,4
* Fixed synchronized display and processing concurrency.
* File data calculations performed as required, vise continuously. Better
display performance.
* Fixed auto file update on events, broken when new script engine added.
* Updated cAmp instance handling for threaded environments.
* cAmp handle routines moved to new files global_amp.cxx/.h.
* Update makefile.am with new files.

6348. flamp 2.2Pre5 available for testing - corrects program exit crash on windows machines.

When I double click my FLDIGI Icon a message saying

"FLDigi modem application stopped working"

I've restored my 'puter to an earlier date, deleted some updates I suspected were the problem, cleared all FLDigi programs from the 'puter, restarted the 'puter and downloaded FLDigi and FLMsg, (the same versions as before the problem.) but that same message keeps returning when I attempt to open it again. Has anyone had the same experience?

What else would you suggest?

Skip,

I have a rare Saturday off tomorrow. I'll try to jump on 30m with you for a prop test.
I might suggest the paNBEMS 30m backup spot at 10.135 USB. This is from the paNBEMS yahoo group description:

Backup band/frequencies for paNBEMS are on 30m at 10.135 USB, 1500 Hz center waterfall and 60m (channel 2) 5.3465 USB, with the alternative of 60m (channel 4) 5.3715 USB, both at the required 1500 Hz center freq, and Olivia 8/500 for the initial call.

Ok, Skip.

I think in the 6 year or so history of paNBEMS, we may have gone to the 30m backup once and we wound up going back to 40m which was better that day.

If we get a few folks on, and the band is long, maybe we can do some relays.

I may be coming in a little late as I'd like to check in on the NY NBEMS net which starts at 10am on 7.036 USB.

6355. SGARN Multicast Schedule Change

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-09-23 01:38:02 UTC
From: Charles Brabham
Topic: 6355 Message: 6355

The SGARN Multicast Schedule is now as follows:

Call: N5PVL

Locator: DM80di

Frequency: 10.142.0 or possibly 10.142.2 - 10.142.4 USB +1000 (One of these,
depending on ongoing activity on frequency.)

Time: 0200-1000 UTC

Mode: MT63-500L

Content: ARRL Bulletins, SGARN Txt and HTML - Emergency information during emergencies.

Note: The best way to utilize this server is to get set up when it starts in the evening, then let your system listen overnight and see what you have in the morning. The first hour is usually subject to interference that drops off later on.

Note that by tuning in for the SGARN overnight multicast, you not only get the latest ARRL bulletins but an idea of overnight propagation conditions on 30 meters.

More information and details about monitoring SGARN multicasts at:

http://www.sgarn.org/forum_library/index.php?topic=9.0

Comments and reception reports always appreciated.

73 DE Charles, N5PVL

6358. 80m Sunday paNBEMS net schedule change (starting 11/2/14)

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-10-05 23:55:50 UTC
From: David Kleber
Topic: 6358 Message: 6358

Starting on Nov 2, 2014, paNBEMS 80m weekly Sunday 0930 ET net will be moved to 1930 (7:30pm) ET. The frequency spot will remain the same at 3.583 USB, 1500 Hz center waterfall.

The new weekly schedule will start with a FLAMP bulletin (approx 20 minutes), followed by requests for fills then calls for stations with traffic only.

Stations wishing to copy the FLAMP bulletin should have the latest version of FLAMP from http://w1hkj.com/download.html and the FLAMP application should be open and running with FLDIGI. FLDIGI should have RxID enabled. The primary FLAMP transmission mode will be MFSK-32 but other modes may be used.

Feel free to direct anyone with questions to me at KB3FXI at yahoo dot com.

The Sunday morning 40m paNBEMS net at 11am ET on 7.0725 USB will remain unchanged.

The goal of the new 80m schedule is to encourage the use of FLAMP with bulletin transmissions for receiving/monitoring stations to copy and to bring liaison stations on board to bring traffic from their local or regional nets.

Good advise, Harry.

I just installed and opened the new version and it's quite a change from 3.21.83. I'm looking forward to exploring and testing the new versions, but during an exercise, or an activation, isn't the time for learning a new layout.

-Dave, KB3FXI

From: "Harry Bloomberg"
Sent: Wednesday, October 15, 2014 8:46 PM
Subject: [wpaares] Please don't upgrade Fldigi/Flmsg before SET!

[Sorry if this goes out twice...I'm not sure if it went out earlier.]

Dave W1HKJ today has released today new versions of Fldigi and Flmsg. Please, please, do NOT upgrade to these new versions before SET! We've not had a chance to test them and we do not want to put our SET digital operations at risk.

We want to be running Fldigi 3.21.83 and Flmsg 2.0.4. Fldigi is available at http://www.w1hkj.com/downloads/fldigi/ . Flmsg is available at http://www.w1hkj.com/downloads/flmsg/ .

I've been in IT for many years. You don't ever want to do any software upgrade just a few days before a major event, especially since I've been finding that the current versions of Fldigi and Flmsg are stable and relatively bug-free.

73,

Harry Bloomberg W3YJ

6365. FLDIGI on Thumb Drive Test

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-10-21 01:13:02 UTC
From: Charles Brabham
Topic: 6365 Message: 6365

Today I concluded my test of operating FLDIGI on a thumb drive, which was accomplished by placing FLDIGI and other associated FL programs in an "FL_APPS" directory, as outlined in the FLDIGI documentation.

I ran FLDIGI and FLAMP successfully from my D: thumb drive for several months. No problems. All related directories and preference files were created there too.

Concluding that it worked just fine and deciding to free up that USN port, today I created an FL_APPS directory at:

C:/ham/sgarn/FL_APPS

- And copied all of the files and directories from my thumb drive to there.

Once I had done that, all that remained was to update the FLDIGI configuration to autoload FLAMP from it's new location, and update FLAMP to autoload it's tx files from the new location. - I also updated the desktop batch file to load from the new location.

First time I tried it out, it worked perfectly. - And now I've freed up a USB port and a thumb drive for other uses.

Running FLDIGI from a thumb drive was an unqualified success. All SGARN multicast were operated from that thumb drive for months with zero issues.

6366. tuning and psk signal on water off frequency.

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-10-21 17:06:02 UTC
From: zdbmdc@...
Topic: 6366 Message: 6366

when I hit tune or transmit on psk I notice that the signal on the waterfall is about 50hz to the left of the received signal. On a recent Michigan digital traffic net we were using using olivia 8/500. I did not notice if the signal was off when transmitting. The net control could still hear me. With psk being so narrow I am concerned that stations I am calling won't be able to see me. When I hit the straight key to send a cw signal the signal is right on in the water fall with the signal I am hearing. Any advise?
Thanks . Andrew Young kb8mua

I am guessing that your sound card has a different sampling rate on receive than it does on transmit. Suggest you use the program CheckSR and put the correction factors into FLdigi. Be forewarned that this "sound card calibration" does not in fact change your soundcard at all, and
you might be well to enter the correctons into any digi program you might use. Find the procedure for using CheckSR on the W1HKJ (Fldigi) website.

6369. 80m Sunday paNBEMS Net Schedule and Procedure Change

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-10-22 15:59:04 UTC
From: David Kleber
Topic: 6369 Message: 6369

Starting on Nov 2, 2014, the paNBEMS 80m weekly HF Net starts at 7:30 PM Eastern Time every Sunday evening with Net Control call on 3.583 MHz USB using 8/500 Olivia, 1500 Hz center waterfall frequency, +/- 500 Hz waterfall frequency. The initial transmission will convey the net purpose and procedures followed by a request for all stations to change to mode MFSK-32, whereby NCS will transmit a FLAMP bulletin, not to exceed 20 minutes in duration. After the FLAMP transmission, NCS will then take calls for stations with traffic only.
The purpose of this net schedule it to encourage stations to monitor and copy the FLAMP bulletin files and to encourage liaison stations from local or other regional nets to move information or messages of interest between the nets.
All are welcome to monitor, but the net will only be taking check ins from stations with traffic. After taking stations with traffic, NCS will open the spot for comments, questions and ragchew from any stations.

Daylight saving time ends at 2 a.m. Sunday, Nov. 2.
That means you will set your clocks back an hour before going to bed on Saturday, Nov. 1.
Remember - spring forward, fall behind.
Daylight saving time is observed so that we can make better use of natural daylight. It began in March and ends on Nov. 2. You will now have more light in the morning but lose it sooner in the afternoon.

Fire departments also recommend this as a good time to check and change your smoke detector batteries.
At this time I plan to do another pre-40M NBEMS net Flamp practice
session beginning around 1015 using Olivia to announcement my plans and then switching to MFSK32 or MFSK64. Open fldigi and then flamp , also have your RxID on.

73,
Frank N3FLL

6375. Fw: [NY-NBEMS] VOA Radiogram, 1-2 November 2014: 8PSK encore [1 Attachment]

Subject: [NY-NBEMS] VOA Radiogram, 1-2 November 2014: 8PSK encore [1 Attachment]

Hello friends,

Last week's surprise mode was 8PSK-125. The 8PSK modes were added to Fldigi
as of version 3.22.00.

Most of you were unable to decode the 8PSK-125 transmission. I think this is
because I used Fldigi 3.22.00 to produce the 8PSK-125 segment, and most of
you installed Fldigi 3.22.01. There was a change to the 8PSK encoding scheme
with version 3.22.01.

This weekend, I will try another transmission in 8PSK-125, this time produced
using Fldigi 3.22.01. If you do not already have Fldigi 3.22.01 installed,
please download it from http://www.w1hkj.com/download.html.

You will notice that 8PSK-125 is fast: 316 words per minute, versus 120 wpm
for our usual MFSK32 mode. Despite its speed, it does have some forward
error correction (FEC), so it might be able to withstand some of the
degradations of shortwave propagation.

Here is the lineup for VOA Radiogram, program 83, 1-2 November 2014:

1:47 Program preview (now)
2:57 Introduction to 8PSK-125 test
3:54 8PSK-125: Radio/TV MartÃ PSAs
4:40 Failure of Antares rocket launch*
11:41 Solar power from Tunisia will supply Europe*
17:56 Recycling e-waste in Ghana without burning*
25:04 Closing announcements with MFSK64 logo
28:25 Surprise mode of the week

*with image

Please send reception reports to radiogram@...

VOA Radiogram transmission schedule
(all days and times UTC):
Sat 0930-1000 5745 kHz
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz

Sun 1930-2000 15670 kHz*
All via the Edward R. Murrow transmitting station in North Carolina.

*North American listeners: With the time change, note that the Sunday 1930 UTC transmission is now one hour earlier for most of you, e.g. 2:30 pm Eastern *Standard* Time.

The Mighty KBC will transmit a minute of MFSK64 Saturday at about 1130 UTC on 6095 kHz, and Sunday at about 0130 UTC (Saturday 9:30 pm EDT) on 7375 kHz. Both frequencies are via Germany. Reports to themightykbc@...

Thank you for your reports from last weekend. I am now constructing the eQSL and will reply soon.

Kim

Date: 2014-10-31 18:18:04 UTC
From: <k3cc@...>
Topic: 6376 Message: 6376
Attachments: 1 described; binary payloads are missing from this source WARC

Attached is a wrap I copied today.. I did get any station ID

I think I have the FLwrap imported into FLmsg, if you click on the attached
it should open as a FLmsg....

If not, right click on attachment, click on “use computer program to open”
open browser to FLmsg, add it to the program list... to do this find FLmsg in the
program file, click on the executable , move it to the browser window and then
open FLmsg, to file, click on import wrap

I hope this works..... had anyone else copied this message and what is the station ID
that sent it ?

They are different. Chester County Ares/Races does NBEMS practice on Thursday evenings after the regular CCAR weekly net. That is for anyone who wants to join from the local area and beyond on UHF via repeaters.

PaNBEMS is a weekly net as well on 80m and 40m and covers a broader area on HF (eg. State of PA and beyond).

From: kb3yck@...
Topic: 6380 Message: 6380

Dave and others,

Any chance that the file name from FLAMP can auto-populate into the pop-up filename field on the SAVE button? I don't mind swapping directories if need be, but re-entering the filename is a bit of a pain. This is a nice to have, and it's okay if this lags beyond the other more important stuff you folks are doing!

Also, managed to cause an abort of FLAMP today when trying to include the path along with the filename.

Both issues: FLAMP 2.1.02 running on IMAC with Yosemite 10.10.

Thx for all your hard work on fl suite.

73's, Dave, KB3YCK

6382. Upgrading FLxxx software

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-11-03 14:42:39 UTC
From: mdannhardt@...
Topic: 6382 Message: 6382

Hello,

New to posting here on the group. I listened in and copied/received files and radiograms during the Sunday net with the exception of the last mode, 8BPSK-250 I think it was (not sure?). The discussion indicated that I needed a newer version of FLDigi than that which I currently have installed.

So my question ...

What is the proper way to upgrade the FLDigi suite software installs? I am running under Windows XP. Should I uninstall that old version and then install the new version? I rather not loose my configuration data, marcos, etc. so I want to make sure to do it correctly. Same question for FLAmp and FLMsg.

Can anyone please advise?

Mike

Greetings, Mike. It shouldn't be necessary to uninstall the old version. Just download and run the exe and it will update the FLDIGI files but it will keep all your config and other saved settings. -Dave, KB3FXI

I use an FT-8800 interfaced through a Signalink to the the data port on the back. It works fine. It is also plug compatible with my FT-8900 and IC-706.

On a non NBEMS note I used the same setup 2 weeks ago with AGWPE for packet in a spot where we had a digipeater accessible but no direct path. In the past I have used this setup as a link to EchoLink.

It might be my imagination but I think the front end of the 8800 is a bit tighter, and therefore more resistant to interference, than the 8900. Perhaps something to do with the extra bands. I haven't done any empirical testing.

Regards
Steven VK2BOS

Which radio is a better cross band ops?

FT-8800 will cross band and you can monitor two VHF/UHF frequency at the same time.

Does the Kenwood TM-V71A do this better or more user friendly?

how about cross band monitoring.??

I don't think any VHF/UHF crossband mobile rigs will crossband on the same band. I think that would require duplexers. In any case, I know for sure the 8800, which I have had for about 8 years now, crossbands only from VHF/UHF or UHF/VHF.
The club I belong to has a Kenwood TM-71A and I think I like it better than my 8800. Both rigs have the standard 6 pin din data port, with which you can hack a cable from an old mouse cable.
Either transceiver would be a good choice.

  I don't think any VHF/UHF crossband mobile rigs will crossband on the same band. I think that would require duplexers. In any case, I know for sure the 8800, which I have had for about 8 years now, crossbands only from VHF/UHF or UHF/VHF.
The club I belong to has a Kenwood TM-71A and I think I like it better than my 8800. Both rigs have the standard 6 pin din data port, with which you can hack a cable from an old mouse cable.
Either transceiver would be a good choice.

I have an FT7800. I am assuming that it is about as susceptible to interference as the 8800 and the 8900. I can not receive with it and transmit on h.f. at the same time. I can with my ancient ft2500. Guess only an EOC with multiple stations need be concerned.

Good point, Dave.
I can tell you that the club station that has the TM-71A is RF soup between the repeater, HF ops and packet/aprs and I only noticed some interference with the aprs on some FM VHF channels with the Kenwood. I would suspect that the 8800 probably wouldn't do as well under the same conditions (based on my mobile ops on VHF as compared to my old Kenwood TM-261A as far as rejection goes), but I haven't ever put the two rigs (8800 and TM-71A) to the test. As I said before, I like the Kenwood better between the two, but that's just based on my feeling rather than any real testing.

Dave/Group

I use TMv71 running Packet as well as Voice on a local repeater. The same time I either have FLDIGI running (Satern Net) Saturday. or it's running PC ALE. I have had no issue with RFI or any thing interfering with any data or use of voice on HF from the Shop radio equipment. (Radio Store)

Subject: [NY-NBEMS] VOA Radiogram, 15-16 November 2014 [1 Attachment]

Hello friends,

Before discussing last weekend's and next weekend's program, a reminder that an archive of past VOA Radiogram broadcasts recorded by Mark Hirst in the UK is kindly maintained by Mark at the URL below. You can decode the modes from these recordings...

https://onedrive.live.com/redir?resid=F24C5799D08FDF1E%21507

Last weekend's 8PSK: As expected, the 640-word-per-minute 8PSK-250 in last weekend's program usually resulted in more errors than the 320-wpm 8PSK-125. There were a few instances of 95-100% decode of the 8PSK-250, including the 360 km from the North Carolina transmitter to my house in northern Virginia, Saturday 0230 UTC on 5745 kHz. It seems that the 8PSK-250 would be most useful in short-hop shortwave propagation, beyond the range of VHF.

This weekend we return to our workhorse MFSK32 mode for the entire program, except for an MFSK64 image and the surprise mode at the end of the show.

Here is the lineup for VOA Radiogram, program 85, 15-16 November 2014 (all MFSK32 except where indicated):

1:45 Program preview
2:52 Solar eclipse and European power grids*
7:53 Human settlements and animal extinction*
11:45 Interfacing human brains via Internet*
16:05 Sesame Street TV show marks 45 years*
19:45 Russian media news*
26:37 Closing announcements with MFSK64 logo
28:05 Surprise mode of the week

*with image

Please send reception reports to radiogram@...

VOA Radiogram transmission schedule
(all days and times UTC):
Sat 0930-1000 5910 kHz (new frequency as of 1 November)
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz

Sun 1930-2000 15670 kHz
All via the Edward R. Murrow transmitting station in North Carolina.

The Mighty KBC will transmit a minute of MFSK64 Saturday at about 1230 UTC on 6095 kHz and Sunday at about 0130 UTC (Saturday 8:30 pm EST) on 7375 kHz. Both frequencies are via Germany. Reports for the KBC transmissions to themightykbc@...

Thanks for your reception reports. I'll try to respond before the end of the weekend.

Please tune in and write this weekend.

Kim

6404. 80m paNBEMS Bulletin/Liaison net info

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-11-13 23:38:58 UTC
From: David Kleber
Topic: 6404 Message: 6404

paNBEMS 80m Bulletin/Liaison Net is requesting the help from NBEMS capable stations to act as Liaisons to practice moving information and messages to and from paNBEMS and other local/regional voice and data nets.
paNBEMS 80m weekly Bulletin/Liaison Net starts at 7:30 PM ET every Sunday evening with NCS call on 3.583 MHz USB (+/- 500 Hz) using 8/500 Olivia, 1500 Hz center waterfall frequency followed by a FLAMP transmission approx 20 minutes in duration using mode MFSK-32.
NCS will then take calls for liaison stations with traffic only. All liaison stations are welcome from within or outside of PA.
This is a traffic only net and we will not be calling for station check ins without traffic.
Any stations are welcome to submit FLAMP files for consideration by paNBEMS to be included in the paNBEMS weekly FLAMP Bulletin by sending a FLAMP file during Eastern Daytime on 7.0725 USB, 1500 Hz Center. KB3FXI station monitors this spot every day. Please make sure that RSID (RXID) is enabled when sending a FLAMP file.
Feel free to email me with questions at kb3fxi at yahoo dot com or leave a voice mail at 412-447-1767.
-Dave Kleber, KB3FXIpaNBEMS Founder and PEMA/ACS Digital Manager
BTW, I'll be working on a macro set for the new net and hope to have that posted to the paNBEMS Yahoo Group in the next week or so.

6410. 80m Bulletin/Liaison Net

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-11-19 18:08:41 UTC
From: dave.kleber@...
Topic: 6410 Message: 6410

November 19, 2014

paNBEMS 80m weekly Bulletin/Liaison Net starts at 7:30 PM ET every Sunday evening with NCS net start announcement on 3.583 MHz USB (+/- 500 Hz) using 8/500 Olivia, 1500 Hz center waterfall frequency followed by a FLAMP transmission approx 20 minutes in duration using mode MFSK-32.

Receiving/monitoring stations should have FLDIGI and FLAMP running with RxID enabled in FLDIGI for auto detection of mode changes. Monitoring stations should consider disabling "searches entire passband" under FLDIGI / Configure / IDs. Be sure to click save then close after making any configuration changes.

After the FLAMP Bulletin, NCS will take calls for liaison stations with traffic only. All liaison stations are welcome from within or outside of PA.

Any stations are welcome to submit FLAMP files for consideration by paNBEMS to be included in the paNBEMS weekly FLAMP Bulletin by sending a FLAMP file during Eastern Time hours on:

7.0725 USB, 1500 Hz Center between 10am ET and 6pm ET and
3.583 USB, 1500 Hz Center between 10pm ET and 8am ET

Please make sure that RSID (TxID) is enabled in FLDIGI when sending a FLAMP file.

Recommended transmission modes are MFSK-32, PSKR/MultiCarrier/5xPSK63R, and MFSK-64.
Please make sure you are transmitting on a clear frequency.

Preferred FLAMP file submissions would be related to your local or regional net descriptions and schedules, announcements of on the air and in person training sessions and schedules, after action reports of drills and exercises, and information directly relating to training and exercise of Amateur Radio Emergency Communications.

Feel free to email me with questions at kb3fxi at yahoo dot com. For those new to FLAMP, I would be welcome to schedule a phone call to help with setup or to schedule an on the air test.

6412. Sitrep Northern Chautauqua County

Date: 2014-11-23 16:57:05 UTC
From: Andrew O'Brien
Topic: 6412 Message: 6412

I have sent sitrep reports via WInlink Winmor on HF regarding the flooding potential in Northern Chautauqua County, NY. This potential for flooding follows the snow fall we had in the past week. I sent to a few of the stations I know are active on Winklink, those that have received Winklink messages from me may wish to check their Winlink inbox. If you would like me to send you the reports as a way of testing your Winlink station, drop me an email. I am also happy to send it as a Flamp message on 40 or 80m today, if interested send me an email. Sorry I was not able to get to the NBEMS nets this morning to send the reports as traffic to the net.

I'm also interested in the sitrep format which is listed on the Internet as a suggested format for ARES/RACES stations. It is not a form in Flmsg. Perhaps there is a better form to use ?

Thanks , as usual , to Glenn WB2LMV for the use of his 40M WL2K server on 7102.

Andy K3UK

Hi Andy, Being new to NBEMS I'm not sure if you are looking for another gateway to connect to or a out of area contact to relay info if needed.
Anyway, if it is the latter, feel free to send any info intended for the Cincinnati area to me via Winlink. I check my "mailbox" several times a day and can be more frequent if needed.
Cincinnati is located in South West OH so I can contact OH, IN and KY message nets if needed.
Hope this helps - and you won't need the assistance in NY. :)

Hi Andy,

Please send me the Winlink message if you have time and I'll pass it around to the folks here in the Bucks County PA ARES group. ny3j@...

Good luck to you guys up there. We are thinking about you. Be safe. I usually use Glen's gateway from here near Phila. He usually has the best path for Winlink and is very reliable.

FYI, we know that Winmor via WL2K would work but I am also pleased to say the PSK125RC5 on 40M passed my fairly lengthy Sitrep #2 to Tom W2TLJ with one simple attempt. Two extreme corners of our county with NVIS HF antennas, no repeaters needed.

Yes, Andy, you never know when you need to go direct to another station(s) if the internet connection is not available. That's why we have NBEMS. We are trying to practice that mindset on VHF here in NYC by leaving messages for each other without internet email being used. Sort of like the old days of personal mailboxes in our packet TNCs. Our thoughts are with you in the snowbound (soon to melt) Western NY.

Here's a good explanation on the advantages of FLAMP for multicast bulletins.

Subject: [NY-NBEMS] How Does Amateur Multicast Work on VHF? [1 Attachment]

  Let's paint the scene:
- some or all local internet connections are down or hobbled
- common data or messages are needed by many locations (ham and non-ham)
- not everyone can be sitting at the PC to receive the transmissions

While we have been practicing with the basic FLdigi software, we can use FLamp & FLmsg to automatically transmit and receive formatted messages, CSV spreadsheet files, small pictures, etc. Using the wider and faster modes, we can blanket a local area with data in a shorter amount of time on VHF than we can on HF and it's limited bandwidth/baudrate issues.

The following is adapted from the SGARN article by N5PVL.

Basically, a single transmitter distributes information to an unlimited number of locations simultaneously. While it is only legal for hams to communicate with other amateur radio operators, there is no law that says that non-hams cannot monitor and also benefit from ham radio communications, nor is it illegal for hams to help them do so by setting up a scanner or VHF receiver along with the multicast software for them. However, all amateur communications must be "addressed" to other amateur radio operators and be of a nature pertaining to amateur radio or their non-commercial EmComm mission. Communications addressed as a QST (to "ALL" amateurs) can be distributed over a given area much faster and more accurately via Amateur Multicast Protocol (AMP) than by any other means. We achieve this by using FLdigi in concert with FLamp (for automated distribution) and FLmsg (for pre-made message forms if needed). Everyone gets it at the same time, and if somebody misses part of it or tunes in at a later time, they will get the information when it is repeated.

Multicast protocol distributes information addressed to "ALL" to an unlimited number of recipients simultaneously. The data is broken up into blocks which are sent along with a checksum, so that the receiving station's FLamp software knows if it has received each block correctly. Once all of the blocks for a given file or message is received 100% correct, then the file is created on the receiving station's computer assuring 100% accuracy. The sending station

can schedule the time of transmission, appropriate gaps to avoid a repeater timeout, the various digimodes to use, when to shutdown and restart the transmissions at a later time.

The transmitting station sends the same data continuously, over and over, so that stations that have not received all of the blocks for a given file can get the fills they need to complete the message, or so that stations tuning in at any given time can get whatever they might have missed. This keeps all of the recipients on the same page, reducing confusion and wasted retries. Multicast distribution eliminates the need for strict reception schedules, and frees up VHF voice communication channels from individual requests for basic information that all must have like frequencies & schedules, operation procedures, EmComm documents, road closures, alerts & requests for materials such as food, water, hams, equipment etc. This kind of information can be distributed quickly, automatically, and 100% accurately with a multicast.

So come join us over the next few weeks and months as we practice using the various parts of the FLdigi suite to make this happen here in NYC (nets are Thursdays at 8PM on 147.360).

On the NY-NBEMS net (Saturdays at 10AM on 7.036 USB) or the USeast-NBEMS net (Wednesdays at 7PM on 7.036 USB), we use narrower digimodes like Olivia 8/500 and MFSK32 and transmissions take longer. During a widespread activation we can use the same techniques on HF with our NVIS capable antennas.

Hello all,
First let me say, I have no connection with GigaParts or ICOM.
This is a great deal on the IC-7200 at $889.
I've had mine for quite some time now and it runs like a tank. If you like doing field ops, no worries in the rain since the rig is weather proof. The twin band pass filtering is excellent and although I prefer to use a USB Signalink, the 7200 has it's own sound card and USB connection.

Hello Everyone,

Anyone have any output problems using windows 8 with fldigi/signal link interface. I know it shouldn't be an
issue but I cannot seam to be able to control my output other than setting the power output of the transceiver.
I tried playing with the volume control when transmitting in the windows sound mixer but I don't see a change in signal output. Maybe I missed something with my Yaesu FT-950 in the menu. Any help would be greatly appreciated. Thanks.

Rick

Rick,
I'm assuming you're using a USB Signalink.
The only adjustments necessary in Windows is to have a high enough playback volume level to trigger the Signalink into transmit. Your TX control on the USB Signalink will drive your audio level out to the rig but you don't want the audio too hot or you will be overdriven.
I'm pretty sure there's a jumper inside the Signalink to boost the output level to the rig.
Generally speaking, you shouldn't have to run more than about 50 watts on digital modes and you want little or no ALC reading on the rig meter. I have my IC-7200 set at 100W full power all the time and adjust my USB Signalink TX pot for the power out while also checking my ALC reading to make sure it doesn't show on the rig meter.

Subject: [NY-NBEMS] VOA Radiogram, 29-30 November 2014 [1 Attachment]

Hello friends,

FLmsg returns this weekend on The Mighty KBC. See details below.

This week on VOA Radiogram, the "surprise mode of the week" becomes the "bonus mode of the week." Because many of you have problems with the RSID, I will divulge the bonus mode so that you can make manual adjustment if necessary.

Here is the lineup for VOA Radiogram, program 87, 29-30 November 2014, all in MFSK32 centered on 1500 Hz except where indicated:

1:37 Program preview
2:39 Dimming lights to see the night sky*
11:27 Cambodian rice wins "world's best" title*
19:53 Color photos of 1963 Soviet Union*
26:29 Closing announcements
27:20 Bonus mode of the week: MT63-2000L

Please send reception reports to radiogram@...

VOA Radiogram transmission schedule
(all days and times UTC):
Sat 0930-1000 5910 kHz
Sat 1600-1630 17860 kHz
Sun 0230-0300 5745 kHz
Sun 1930-2000 15670 kHz
All via the Edward R. Murrow transmitting station in North Carolina.

The Mighty KBC will transmit a minute of MFSK64 Saturday at about 1230 UTC on 6095 kHz, and Sunday at about 0130 UTC (Saturday 8:30 pm EST) on 7375 kHz. Both frequencies are via Germany. Reports to Eric at themightykbc@...

This weekend, the MFSK64 transmissions on The Mighty KBC will be in FLmsg format. If you do not have the FLmsg software, download it from the same source as FLdigi: http://w1hkj.com/download.html

To make FLmsg work with FLdigi, in FLdigi: FLdigi: Configure > Misc > NBEMS > Under "Reception of flmsg files" check both "Open with flmsg" and "Open in browser." Under that indicate where your FLmsg program is located, for

example C:Program Files (x86)\flmsg-2.0.5\flmsg.exe.

If all goes well, the text from The Mighty KBC will pop up on your web browser.

Thanks for your reception reports for program 86. I hope to have all them answered by the end of the weekend.

If you are in the USA, Happy Thanksgiving!

Kim

I am trying to run Win 8.1 and Fldigi 3.22.01 as a back up to my regular XP box. With XP I have had no issues. This week I checked into the Sunday net with my XP box...no problems.

But as I monitored the net with my second computer running win 8.1 and fldigi 3.22.01 it will stop receiving the feed. I try to close out the program to restart it and windows asks me if I want to wait for the program to respond or close it. I close it.

When I restart the program it will receive again for a moments or so. Then the waterfall stops again. I did a google search and looked thru the conversations before posting. I see squelch issues. Not sure if this is what I am experiencing..

Hello all, I will be on the air with the new FLDIGI release this Wednesday and Thursday on 7.0725 MHz USB. Feel free to jump on and put out a call or send a FLMSG or FLAMP. We will probably be seeing a new FLAMP maintenance release soon, too. Once both of these updates are fully tested, we'll be recommending that all stations make the updates. -Dave, KB3FXIpaNBEMS Founder and PEMA/ACS Digital Manager

  Version 3.22.02, Maintenance release

- Corrected MT63 and Olivia tx signal generation to avoid sound codec overflow
- changed xmt signal shaper to optimize s/n decoding with fldigi decoder.
- Update to list of contibutors
- Update to language selector entries
- Update recognitions page in user docs
- Removed percent_done from language list box
- Update to Polish translation
- Update to Spanish translation
- Added Dutch translation
- KPQSL / SQL state conflict - Ensure state flags are set correctly for the given IO port on start up.
- Add Latest 8PSK modes and seperate PSK modem types to documentation
- Freq Control Fix for determining max integer of control value
- CW - fix combobox selection / setting for test char added pretone.
- fltk-1.3.3 compatibility - correct all widgets that use set_active function to prevent conflict with new Fl::widget set_active method added in 1.3.3
- RTTY - Fixed decoder for baud rate > 110
- cty.dat confusion - remove ambiguity of whether to locate the folder which contains "cty.dat", or the file itself.
- KISS log overflow - prevent Win status log overflow
- New install crash - fix for various uninitialized controls in new install wizard
- EmComm 8PSK modes - update to various baudrates
- MT63 doc - Added documentation on Long Integration factor
- psk/pskr squelch - changed squelch to fast attack / slow decay processing
- modified rtty and psk viewers to eliminate modem specific code in the UI elements restricted psk multichannel viewer to modes

- PSK31, PSK63, PSK63F and PSK125
- QPSK31, QPSK63 and QPSK125

- List box initializers - Corrected initializers for some configuration list box controls
- Added macro tags

- <ANTENNA> - my antenna
- <BAND> - current operating band
- <CPS_N:nnn> 5 letter code group modem test
- <WAV_N:nnn> 5 letter code group modem test

- Analysis update - restored 3.21 analysis algorithm; changed scope presentation
- embedded browser - restore size/position initialization of embedded browser

6425. Re: [paNBEMS] Digest Number 1504

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-12-02 11:36:31 UTC
From: Mike Dannhardt
Topic: 6425 Message: 6425

What is the best practice upgrade procedure for the FLxxx programs?
Should the prior versions be uninstalled and then the new ones
installed? Can it be done this way and not loose custom
configuration/macros and logs? I am on WinXP (unfortunately).

Thanks,
Mike / KA4CDN / Fairfax County VA

Just do the upgrade and don't worry about the old program. If you wish later to delete them you can but I have several old ones just in case something goes wrong with an upgrade. Don't delete the program before you upgrade, no need.

Best practice, do NOT uninstall your current versions of programs until you
are sure new versions are working well. We keep several old versions on
our computers just we can go back if necessary. You can delete the desktop
icon of the old version so that you only have current one showing.
Configuration options are installed on new version from old version.

Subject: [NBEMSham] flamp version 2.2.00 posted

  http://www.w1hkj.com

Please read either the on-line help

http://www.w1hkj.com/flamp-help/index.html

or the adobe reader manual for this version

http://www.w1hkj.com/downloads/flamp/FLAmp_2.2_Users_Manual.pdf

to learn all of the new functionality that has been added to this NBEMS application for Amateur Multicast Protocol.

Thanks for all of the hard work that Robert, KK5VD, has put forth to bring this version to fruition.

73, Dave, W1HKJ

Attachments: 1 described; binary payloads are missing from this source WARC

FLdigi won't send transmit audio to the radio.
If I push the sound card's test button, I transmit those three test beautiful tones.
The sound level indicator in the sound card control panel says FLdigi is sending audio to the sound card.
If I boot up HRD and DM780 and then boot up FLdigi, they both work.
Same problem with FLdigi 3.22.02 and 3.22.01.
I have done all the things those of us who know little do:
Reboot the computer
Uninstall and reinstall FLdigi
Delete all FLdigi files and reinstall
Do a Memory check...one of those four hour ones

Make sure the internal sound card volume level is turned all the way up.

Are you using Signalink interface??
If so does the the RED transmit light come on when you try transmitting?
If yes, turn up the TX control and try again.
IF no, go into FLDIGI Config, Sound Card.. make sure Capture: = 'USB Audio Codec' & Playback: = 'USB Audio Codec'
save and close.. close fldigi and re open

Thanks for sticking with me Jack No Signalink. The TS480 does not need an interface. I am using a Ceative Audigy NX2 Soundblaster external usb sound device. And it works just fine with DM780. It also works for receive using FLdigi. FLdigi won't grab the transmit sound card. Could have something to do with the memory the computer can't read, as mentioned in the attachment. ----- Original Message ----- From: "Jack Dellinger kc3jdjack@... 6436. Issue with Browser and CSV veiwing

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-12-06 04:21:50 UTC
From: samuelcollins@...
Topic: 6436 Message: 6436

Strange issue I having. My NBEMS is configured to automatically open my web browser to display received messages in FLMSG under the configure NBEMS table of fldigi. Works for ICS 213, bulletins, etc. No problems there. But on CSV transmissions, the browser won't kick open to show me a table like it does for others in my training group. Any ideas why CSV is treated differently?
Sure I can still see the message correctly if I click "view as CSV" in FLMSG after recieving but still trying to get to the bottom why the browser view works for other transmitted forms and not CSV for me

6437. V3.22 upgrade UI problem

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-12-07 12:54:53 UTC
From: mdannhardt@...
Topic: 6437 Message: 6437

Upgraded to V3.22.02 this AM. Running on WinXP.

I do not have CAT control on my old rig so enter transceiver freq. manually. On the prior (3.21) version I cuold left click on a digit in the control to increase it by one, right click on a digit to decrease it. Very handy.

In the new version something is broken such that both right and left do the same thing, either increase or decrease the digit, strangle enough, depending upon the last way I went while running the 3.21 version. I.e., if I left click a digit in V3.21, shut it down, start V3.22 it doesn't matter whether I left or right click a digit, it always increases. Likewise, if I right click to decrease in V3.21 then when running V3.22, both right/left decrease the digit.

The left/right functionality otherwise seems to be ok in V3.22, i.e., works as expected in the receive print out area either selecting text or invoking the context popup menu.

I'll have to revert to 3.21 until I figure this out. Please let me know if I need to provide addition info or if I need to operate differently.

Regards,
Mike / KA4CDN

Topic: 6423 Message: 6438

I figured out my issue. With windows 8.1 I had to use the following under the Volume mixer :

capture : microphone USB Audio Codec
playback : speakers USB Audio Codec

with port audio checked

Now FLDIGI shows up in the volume mixer :)

Just checked into the net (12-7-14) with the backup Yaesu 897D and G5RV with east / west alingment. Normally I run my other 897D with a G5RV going north/south

I've since been advised, and verified, that clicking on the top of a digit increases the value, click on the lower part of the digit decreases it. This seems like an oddity in UIs. I can't remember ever seeing something like that functionality. (thanks for the info Dave, KB3YCK)

Robert,

Good point I can see that. I tend not to keep up with current computer technology too well and skip generations I think. I went from punch cards right to mouse input. Now I'm skipping the touch screen era BUT for Christmas I've asked for a cranial implant hihi!!

But seriously, I still wonder why the right click/left click functionally no longer works. It really does seem like a bug rather than a feature considering that the increase/decrease direction seems to be dictated by the last direction used in the prior version of FLDigi. I suspect it is not a bug in FLDigi directly but more likely in the GUI library used.

Cheers and 73 to all,
Mike / KA4CDN

6442. FLAMP - preamble/hdr repeat during multiple sends

Yahoo group: paNBEMS (2012 — 2018)
Date: 2014-12-08 17:22:15 UTC
From: W. T. Jones
Topic: 6442 Message: 6442

Hello All,

Last night during my weekly digital bulletins via a local repeater I had an instance where one of the stations missed the preamble for one of the files. The hdr report was set to send "2x" but either through a glitch in the transmission or the station being late on the uptake or me not having the TxID (the real culprit here) set he missed the preamble. Since this is being sent as a broadcast there is limited interaction for a fill. I also have a listener who is not yet a Ham who listens by scanner. The missed preamble seems to be a problem in these conditions. I was wondering if the developers would consider an option to repeat the headers with each repeat of the file's transmission to help alleviate this problem. I have the files set to send "2x" as well. If all goes well everything works flawlessly. When the humans get involved things sometimes don't work.

Please let me know if this is a possible future.

Many thanks for a great software.

Running Fldigi 3.22.02 and Flamp 2.22.0 on Ubuntu 14.04 LTS, Windows Vista, and Debian Wheezy on a Beaglebone. No problems have presented as far as I can tell.

Regards,

W.T.

Mike,
    Understand in trying to keep up with the tech. Even though I'm a tech by description, I have trouble keeping up with the shear volume of changes. The last round of change to FLDIGI GUI was to support touch screen tablets.
The scroll wheel on the mouse is available to change the frequency. That way if you have an aiming problem with the mouse cursor you don't have to figure out where the dividing line is to select the right direction of change.
Robert

  Robert,

Good point I can see that. I tend not to keep up with current computer technology too well and skip generations I think. I went from punch cards right to mouse input. Now I'm skipping the touch screen era BUT for Christmas I've asked for a cranial implant hihi!!

But seriously, I still wonder why the right click/left click functionally no longer works. It really does seem like a bug rather than a feature considering that the increase/decrease direction seems to be dictated by the last direction used in the prior version of FLDigi. I suspect it is not a bug in FLDigi directly but more likely in the GUI library used.

Hello WT,
The other way to send duplicates of the same file is to drag the same file twice to the DnD. Make sure you enable interval timer. You will need to "XMIT ALL" to make this work. Enabling header modem will add an additional RSID between the two segments. If you don't want to increase the tx time with header modem enable. Select the same modem as what's listed in the TX pane.

Robert, On our very first paNBEMS Bulletin/Liaison Net I had 3 separate files and sent with transmit all. But it occurred to me that if someone tuned in late, they would only get the last files in the transmission. So, I decided to transmit one larger file with 3x Xmit repeat. The problem is, as WT described, if someone comes in late and misses the header, they have to submit a missing preamble request. I tried the various settings for transmit interval and header modem but I can't seem to come up with the desired result, which would be 3 repeats of the single file transmission, each of which start with the header data with a 2x repeat of the header. Where we're trying to go with the FLAMP bulletin is to get across the idea that at the early onset of an emergency situation or disaster, anyone can tune to the paNBEMS spots and catch a bulletin transmission in progress and will likely eventually get all the blocks and the file while minimizing the need for fills. -Dave, KB3FXI

I have found that giving each instance of the same file a different file name (file1, file2, file3 etc.) will return the desired result.

Charles, That's a little bit of extra screwing around, but certainly is a simple fix!
 I'll be rolling with that on our next Bulletin/Liaison net! Thanks. -Dave, KB3FXI
